## 安全、質量及保安政策

安全、質量及保安是港龍航空的核心價值。藉著各員工絕不妥協地致力推行各種持續提升質量、保安及安全管理系統計劃，我們務求在這些方面均達到最高的水平。

港龍航空一直以來均十分重視及鼓勵任何有關運作安全及保安事件的報告。我們有既定政策，鼓勵每一位員工向公司匯報任何可能影響航班及地勤營運安全及保安的情況及資料，並積極推動這種文化。我們更製訂了一套程序，適用於航空安全報告、機艙安全報告、地勤安全報告、品質審計報告及保安審查報告所收集紀錄及發放的資訊，確保溝通可以在不受拘束的情況下進行。

我們亦確立機制，以量度及訂立在所有有關安全、質量及保安方面的主要表現水平，並以嚴謹的風險評審，按其重要性訂定改善措施的優先次序。

為建立互信關係，港龍航空推行公平文化的政策，決不會紀律處分任何匯報有關航班安全事件的員工。但如果有關資訊是來自其他來源，或員工刻意漠視既定的政策及程序，此項政策則不適用。我們希望從錯誤中學習，以不斷提升水平。

作為行政總裁，我自然責無旁貸，除致力履行承諾提供安全的運作及工作環境，我務請大家積極負責，讓港龍航空繼續在安全、品質及保安方面均達致最高的水平，讓顧客、員工及商業夥伴均受惠，並保持公司在這方面的業界領導地位。

楊偉添

## SAFETY, QUALITY AND SECURITY POLICY

Safety, quality and security are core values of Dragonair. We are dedicated to achieving the highest standards in these disciplines by the uncompromising efforts and vigilance of every employee in implementing continuous quality improvement, security and safety management system programmes that are in place in Dragonair.

It is imperative that we have uninhibited reporting of all incidents and occurrences which compromise the safe and secure conduct of our operations. We have a policy of an open reporting culture where every employee is encouraged to communicate any information that may affect the integrity of flight and ground safety and security. Such communication is free of reprisal. Our method of collecting, recording and disseminating information obtained from Air Safety Reports, Cabin Safety Reports, Ground Safety Reports, Quality Audits and Security Inspections has been developed to achieve this aim.

We have established methods to measure and set key performance standards in all the safety, quality and security disciplines coupled with a rigorous process of risk assessment in order to prioritise the deployment of corrective actions in a timely and efficient manner.

To engender mutual trust, Dragonair has a just culture policy where it will not take disciplinary action against any employee who discloses an incident or occurrence involving safety. This policy shall not apply to information received by the company from a source other than the employee, or when the employee knowingly disregards established policies and procedures. We constantly improve our standards by learning from our own mistakes and errors as well as those made by others.

As the Chief Executive Officer I am ultimately accountable and fully committed to providing a safe operational and working environment. However I require you all to take responsibility to ensure Dragonair maintain its industry position as a leader in providing our customers, employees and business partners with the highest level of safety, quality and security.

  
Patrick Yeung  
Chief Executive Officer  
August 2011

KASQSPDMS-201108-REV2

IMPORTANT		

### **SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
 As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

### **TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

#### **PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

#### **PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

### **Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

### **ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

### **ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

		30 MAR 12

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

-----------------------------------------------------------------------------------------------------------------------------------------------------------	----------------	----------------------------

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

00, 01, 02, ...	:	Numbering for ABN, GEN, OPS, OEB PROC sections
01A, 03B, ...	:	Numbering and index (A, B, ...) for procedures written on several paper pages
1/10, 3/5, ...	:	Numbering for NP-NP, FPE-SPO
C1, C2	:	Index of the back cover page interior
C3	:	Index of the back cover page exterior
"BLANK"	:	Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page)

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

## CABIN OVERPRESSURE

Apply the following procedure (not displayed on ECAM) in case of total loss of the cabin pressure control leading to overpressure

PACK 1 or 2..... OFF

BLOWER + EXTRACT..... OVRD

*Cabin air is extracted overboard.*

$\Delta P$ ..... FREQUENTLY MONITOR

● **If  $\Delta P > 9$  PSI**

PACK 1+2..... OFF

**LAND ASAP**

Before 10 min from landing:

PACK 1+2..... OFF

BLOWER + EXTRACT..... AUTO

**CAUTION**

Check that  $\Delta P$  is zero before opening the doors.

## LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The "CAB PR LDG ELEV FAULT" message is displayed on the ECAM
- A "MAP NOT AVAIL" message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### ■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:

#### ● When the system has recovered:

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### ■ DESCENT (IF TIME PERMITS) :

#### ● When the system has recovered:

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

The method for approach speed computation is given in the QRH ABN 80 (Refer to VAPP Calculation).

FLT ON BAT ONLY

Flight time on batteries only may be increased to at least 30 min as follows:

ENG MODE SEL..... NORM

ANTI ICE PITOT 1 C/B (D02)..... PULL

26 V ADIRU 1 C/B (F07).....PULL

*CM 1 altitude, speed, and vertical speed indication on PFD are lost. Use standby instruments*

● **7 min before landing:**

ANTI ICE PITOT 1 C/B (D02)..... RESET

● **After 1 min:**

<b>CAUTION</b>	This time delay is necessary to ensure reliable speed information even in icing conditions when the ADIRU is reset to ON.
----------------	---------------------------------------------------------------------------------------------------------------------------

26 V ADIRU 1 C/B (F07).....RESET

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
 In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● **If one or more electrical latches (strikes) are faulty:**

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● **If two pressure sensors are faulty:**

Automatic latch release is not available, in case of cockpit decompression.

● **If no LED on the CKPT DOOR CONT panel is on:**

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

■ **Repeat the following until landing configuration is reached:**

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered. In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.

● **As speed reduces through VFE NEXT:**

FLAPS LEVER..... ONE STEP DOWN

■ **When landing configuration is established:**

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

■ **IF SLATS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION**

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

■ **IF FLAPS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION:**

● **If FLAPS jammed at 0**

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

- Note:
- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
  - In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED

Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
Slats					
S = 0	NO LIMITATION	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1	230 kt				177 kt
S = 1					
1 < S ≤ 3	200 kt		200 kt	185 kt	177 kt
S > 3	177 kt		177 kt	177 kt	

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>

Intentionally left blank

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.03</b>
		30 MAR 12
<b>SIDESTICK/RUDDER PEDALS STIFF</b>		
<p>Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:</p> <ul style="list-style-type: none"><li>- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or</li><li>- One sidestick and the rudder pedals at the same time.</li></ul> <p>The piloting technique remains the same: The aircraft remains responsive. However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.</p> <p>AP DISENGAGEMENT.....CONFIRM</p> <p>CONSIDER TRANSFERRING CONTROL TO PNF</p> <p>● <b>FOR DECRAB, ROLLOUT, OR ENGINE FAILURE</b></p> <p>BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL</p>		

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div>27.05</div> <div>30 MAR 12</div>
<b>STABILIZER JAM</b>		
<p>The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.          The flight control normal law remains active in this case and there is no ECAM warning.</p> <p>AP..... OFF          MAN PITCH TRIM.....CHECK</p> <p><i>The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.</i></p> <p>● <b>IF MAN TRIM AVAIL:</b></p> <p>TRIM FOR NEUTRAL ELEV  <i>If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).</i></p> <p><b>APPR PROC</b></p> <p>● <b>IF MAN TRIM NOT AVAIL:</b></p> <p>FOR LDG.....USE FLAP 3  <i>Do not select configuration full so as not to degrade the handling qualities.</i></p> <p>GPWS LDG FLAP 3..... ON</p> <p>CAT 2 INOP</p>		

**FUEL IMBALANCE**

FOB..... CHECK  
 Compare the FOB + FU, with the FOB at departure.  
 If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. Refer to ABN-28 FUEL LEAK.
----------------	------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON  
 ● On the lighter side and in the center tank:  
   FUEL PUMPS.....OFF  
 ● When fuel is balanced:  
   FUEL PUMPS (WING + CTR)..... ON  
   FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

## FUEL LEAK (Cont'd)

ENGINE RESTART..... CONSIDER

**CAUTION**

Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

● **If fuel smell in the cabin:**

APU (if ON)..... OFF

*This prevents additional fuel loss through the APU feeding line.*

● **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**

CTR TK PUMP 1+2..... ON

### **FOR LANDING**

**CAUTION**

Do not use reversers.

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or diagonal line),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, Upper ECAM or MCDU 1 is(are) affected.

GEN 1.....OFF

#### ■ If DUs do not stop flashing:

GEN 1..... ON

#### ■ If DUs stop flashing:

GEN 1.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2.....OFF

#### ■ If DUs do not stop flashing:

GEN 2..... ON

#### ■ If DUs stop flashing:

GEN 2.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ AFFECTED DU IS BLANK or the DISPLAY IS DISTORTED:

DU (affected).....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected)..... USE

*Transfer SD to F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected).....USE

### ■ DIAGONAL LINE ON THE AFFECTED DU:

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

EIS DMC SWITCHING..... AS RQRD

DISPLAY UNIT FAILURE (Cont'd)

- **If unsuccessful:**  
DU (affected)..... OFF THEN ON  
  
*Note:     The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
- **INVERSION OF THE EWD AND THE SD:**  
ECAM UPPER DISPLAY .....OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 1.5em; font-weight: bold;">32.02</div> <div style="text-align: center;">30 MAR 12</div>
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <u>WHEEL</u> SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <u>L/G</u> GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**PREPARATION**

CABIN CREW.....	NOTIFY
ATC.....	NOTIFY
GALLEY.....	OFF
<i>Consider fuel reduction to a safe minimum.</i>	
● <b>If NOSE L/G abnormal:</b>	
CG location (if possible).....	AFT
- 10 passengers from front to rear moves the CG roughly 4 % aft.	
- 10 passengers from mid to rear moves the CG roughly 2.5 % aft.	
● <b>If one MAIN L/G abnormal:</b>	
FUEL IMBALANCE.....	CONSIDER
<i>Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.</i>	
OXYGEN CREW SUPPLY.....	OFF
SIGNS.....	ON
CABIN and COCKPIT.....	PREPARE
- Loose equipment secured.	
- Survival equipment prepared.	
- Belts and shoulder harness locked.	

**APPROACH**

GPWS SYS.....	OFF
L/G lever.....	CHECK DOWN
GRVTY GEAR EXTN handcrank.....	TURN BACK TO NORMAL
AUTOBRAKE.....	DO NOT ARM
EMER EXIT LT.....	ON
CABIN REPORT.....	OBTAIN
A/SKID & N/W STRG.....	OFF
MAX BRAKE PR.....	1000 PSI
● <b>If one or both MAIN L/G abnormal:</b>	
GROUND SPOILERS.....	DO NOT ARM

**BEFORE LANDING**

RAM AIR.....	ON
BRACE FOR IMPACT.....	ORDER
● <b>If the external light condition is poor at landing:</b>	
DOMELT.....	DIM

**FLARE, TOUCH DOWN AND ROLL OUT**

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.

Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

## LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

● **If NOSE L/G abnormal:**

NOSE..... MAINTAIN UP

*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*

BRAKES (compatible with elevator efficiency)..... APPLY

ENG MASTERS..... OFF

*Shutdown the engines before nose impact.*

● **If one MAIN L/G abnormal:**

ENG MASTERS..... OFF

*At touchdown, shut down both engines.*

FAILURE SIDE WING..... MAINTAIN UP

*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*

DIRECTIONAL CONTROL..... MAINTAIN

*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

● **If both MAIN L/G abnormal:**

ENG MASTERS..... OFF

*Shut down the engines in the flare, before touchdown.*

PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

### WHEN A/C STOPPED

ENG (all) and APU FIRE pushbutton..... PUSH

*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*

ENG (all) and APU AGENT..... DISCH

■ **If Evacuation required:**

EVACUATION..... INITIATE

- All emergency and passenger doors may be used to evacuate the aircraft.

- Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

■ **If Evacuation not required:**

CABIN CREW and PASSENGERS (PA)..... NOTIFY

*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

## ADR 1 + 2 + 3 FAULT

The ECAM does not display this procedure. In the case of a triple ADR failure, the ECAM only displays dual ADR warnings.

ADR P/B (all)..... OFF  
STBY INST..... USE

Note: Disregard ECAM actions for AIR DATA SWTG and ATC since these have no effect in the case of a total loss of ADRs.

### ASSOCIATED PROCEDURES

## F/CTL ALTN LAW

### (PROT LOST)

MAX SPEED..... 320/0.82

See the following table for the IAS/M relationship for 0.82

FL	390	370	350	330	310	290	280 and below
MAX SPD	252	265	278	290	305	315	320

WHEN L/G DN: DIRECT LAW

At landing gear extension, control reverts to direct law in pitch, as well as in roll.

Note: Use manual control of cabin pressurization.

MODE SEL.....MAN

MAN V/S CTL.....AS RQRD

### STATUS

MAX SPEED..... 320/0.82

*Note: In case of a go-around, respect maximum speed 215 kt in CONF 1+F, due to the loss of flap auto retraction to CONF 1.*

<b>CAUTION</b>	<i>Check that the outflow valve is fully open, and that cabin altitude is at airfield elevation before opening the doors.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------

<sup>(1)</sup> At slats' extension, full rudder travel authority is recovered.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>34.02</b>
		30 MAR 12

Intentionally left blank

NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 ° ,
- 0.9 min for latitudes at or above 55 ° and below 70 ° ,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

- **If the message occurs during ILS/LOC approach (LOC green):**  
DISREGARD it.
- **If the message occurs in climb, cruise, or descent:**  
CHECK navigation accuracy, using raw data.
  - **If the check is positive:**  
NAV mode and ND ARC/ROSE NAV may be used.
  - **If the check is negative:**  
HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

- **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**  
Use the associated FD/AP.
- **If not:**  
Deselect GPS and revert to basic information.
- **If the message occurs during a Non Precision Approach (NPA):**
  - **Overlay approach:**  
SELECT HDG, or TRK, and use raw data.
  - **GPS or RNAV approach:**  
GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.  
During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
*ALIGN light on during 30 s.*  
*ATT MODE displayed on CDU.*  
 LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

Depending on the CDU keyboard installed, an “H” may be written on the “5” key:

- If “H” is written on the “5” key:  
 H KEY..... PRESS  
*Degree marker, 0 decimal point, ENT and CLR lights come on.*  
 A/C HEADING..... ENTER  
 ■ If “H” is not written on the “5” key:  
 A/C HEADING..... ENTER  
*Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.*  
*Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.*  
*Heading will be displayed on the associated ND.*  
*“HDG-ATT MODE” will be displayed on CDU.*

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and VMAX.*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s).....OFF  
 REMAINING AIR DATA.....CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR.....KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs.....OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF.....USE FLAP 3

APP SPD.....VLS +10

LDG DIST PROC.....APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST.....CLB

FLAPS.....RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

ENG DUAL FAILURE - FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :  
**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
THR LEVERS..... IDLE  
FAC 1.....OFF THEN ON  
ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.  
OPTIMUM RELIGHT SPD.....280 KT

*Note:* In the case of an “ENG DUAL FAILURE” during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.  
In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).  
LANDING STRATEGY.....DETERMINE  
*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*  
VHF1/HF1  /ATC1.....USE  
ATC.....NOTIFY

- **IF NO RELIGHT AFTER 30 SEC:**  
ENG MASTERS..... OFF 30 S/ON  
*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*  
CREW OXY MASKS (Above FL 100).....ON
- **WHEN APU AVAIL FL < 200:**  
WING ANTI ICE..... OFF  
APU BLEED..... ON  
ENG MASTERS (one at a time)..... OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
GALLEY.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
*Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).*

*Engine Agent 2 is not available.*  
EVACUATION..... INITIATE  
ELT  ..... CHECK EMITTING  
*If not, switch on the transmitter.*

## ENG DUAL FAILURE - NO FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
THRUST LEVERS..... IDLE  
FAC 1.....OFF THEN ON

*Then apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.*

OPTIMUM SPEED.....220 KT/GREEN DOT

*Initially, fly 220 kt, because the PFD may not display the correct green dot speed. Then fly the green dot speed according to the following table:*

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

*At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind). Average rate of descent is approximately 1 600 ft/min .*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached or the most appropriate place for a forced landing/ditching.*

■ **Normal :**

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION

External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

● When burning has stopped :

MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1  $\geq$  5 units, N2  $\geq$  5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0
5	70.0	69.0	68.0	67.0	65.0	64.0	60.0	55.0

50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE

*Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.*

NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN

*Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.*

DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

## BOMB ON BOARD (Cont'd)

- **When at CAB ALT+2 500 ft:**
  - 1 PSI DELTA P..... MAINTAIN
  - GALLEY..... OFF
  - FLAPS (fuel permitting)..... AT LEAST CONF 1
  - For landing, use normal configuration.*
  - LANDING GEAR (fuel permitting, except for flight over water)..... DOWN
- **For any other steps of descent:**
  - 1 PSI DELTA P..... MAINTAIN
- **During approach:**
  - CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**
    - EVACUATION..... INITIATE
    - Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**
    - CABIN CREW and PASSENGERS (PA)..... NOTIFY

### **CABIN PROCEDURES**

If a suspect device is found in the cabin:

<b>WARNING</b>	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
<b>WARNING</b>	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
<b>CAUTION</b>	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

**EOD PERSONNEL ON BOARD..... CHECK**

*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

**BOMB..... DO NOT OPEN**

**BOMB..... DO NOT CUT WIRES**

**BOMB..... SECURE AGAINST SLIPPING**

**BOMB..... AVOID SHOCKS**

*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

**PASSENGERS..... LEAD AWAY FROM BOMB**

*Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*

*Seat backs and tray tables must be in their full upright position.*

*Service items may need to be collected in order to secure tray tables.*

**PORTABLE ELECTRONIC DEVICES..... SWITCH OFF**

*The cabin crews must command passengers to switch off all portable electronic devices.*

## BOMB ON BOARD (Cont'd)

### BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

### EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

### GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

#### ● If the bomb can be moved:

#### RH AFT CABIN DOOR SLIDE.....DISARM

#### LEAST RISK BOMB LOCATION (LRBL).....PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

### BOMB INDICATION LINE.....POSITION

Note: *A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

### BOMB.....MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

**CAUTION** Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

### LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

*Build up at 25 cm (10 in) of wetted material around the sides and on top of the bomb.*

## BOMB ON BOARD (Cont'd)

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

### PASSENGERS.....MOVE/ADVISE

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

### CABIN CREW..... NOTIFY COCKPIT CREW

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

### EVACUATION/DISEMBARKATION.....EXECUTE

*Evacuate through normal and emergency exits on the opposite side of the "bomb" location. Do not use the door just opposite the "bomb".*

*Use all available airport facilities to disembark without delay.*

## DITCHING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.*

### **PREPARATION**

ATC/TRANSPONDER (if available)..... NOTIFY/SELECT A7700

		30 MAR 12
FORCED LANDING (Cont'd)		
<div>■ If Evacuation not required: CABIN CREW and PASSENGERS (PA)..... NOTIFY</div>		

## EMER DESCENT

### IMMEDIATE ACTION

CREW OXY MASKS..... ON  
EMER DESCENT.....ANNOUNCE(PA)

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS..... ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

#### CAUTION

*Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.*

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note: *The recommendation is to descend with the autopilot engaged.  
Use of the autopilot is also permitted in EXPEDITE mode .*

ENG MODE SEL.....IGN

ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note: *Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● In the final approach stages

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.  
Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

REVERSE THRUST..... USE MAX AVAILABLE

● After nosewheel touchdown

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58
20	83	81	78	74	71	66	61	56
25	83	81	78	74	70	64	59

40	83	80	73	67				
45	82	76	70					
50	79	73						
55								

## STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

**NOSE DOWN PITCH CONTROL..... APPLY**

*This will reduce angle of attack*

Note: In case of lack of pitch down authority, reducing thrust may be necessary.

**BANK..... WINGS LEVEL**

● **When out of stall (no longer stall indications) :**

**THRUST..... INCREASE SMOOTHLY AS NEEDED**

Note: In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

**SPEEDBRAKES..... CHECK RETRACTED**

**FLIGHT PATH..... RECOVER SMOOTHLY**

● **If in clean configuration and below 20 000 ft:**

**FLAP 1..... SELECT**

Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

## STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

**THRUST..... TOGA**

At the same time:

**PITCH ATTITUDE..... 15 °**

**BANK..... WINGS LEVEL**

Note: When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

TAILSTRIKE

In the event of a tailstrike, apply the following procedure:

LAND ASAP

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.*  
*Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

## VOLCANIC ASH ENCOUNTER

● **If the aircraft enters a volcanic ash cloud:**

180 ° TURN..... INITIATE  
ATC..... NOTIFY  
A/THR..... OFF  
THRUST (conditions permitting).....REDUCE  
CREW OXYGEN MASKS.....ON/100 %/EMER  
CABIN CREW.....NOTIFY  
PASSENGER OXYGEN.....AS RQRD  
ENG ANTI ICE..... ON  
WING ANTI ICE..... ON  
PACK FLOW..... HI

Note: If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

APU..... START  
ENGINE PARAMETERS..... MONITOR  
AIRSPEED INDICATIONS.....MONITOR

If airspeed is unreliable or lost, Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.

Note: If all engines flame out and speed indications are lost, Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

Note: If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

CAB PRESS MODE SEL..... MAN  
MAN V/S CTL..... FULL UP

Due to the increased noise level, pay particular attention to visual warnings.

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ At takeoff

#### ■ If before V1

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ If after V1

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA..... SET OR CONFIRM  
 AP (if engaged)..... KEEP  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

**DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.**

**CLOSELY MONITOR FLIGHT PATH AND SPEED.**

**RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.**

WINDSHIELD/WINDOW ARCING

Affected WINDOW/WINDSHIELD ANTI ICE C/B..... PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

WINDSHIELD/WINDOW CRACKED

DIAGNOSIS OF INNER PLY.....PERFORM  
*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ If no crack on cockpit side:

No limitation  
*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ If cracks on cockpit side:

MAX FL..... 230/MEA  
*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain ΔP 5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

*Note:*    The following procedure allows maintaining ΔP 5 PSI in manual cabin pressure mode.

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

ΔP = 5 PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● When starting the descent for approach:

CAB PRESS MODE SEL..... AUTO

*Note:*    If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL.....FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

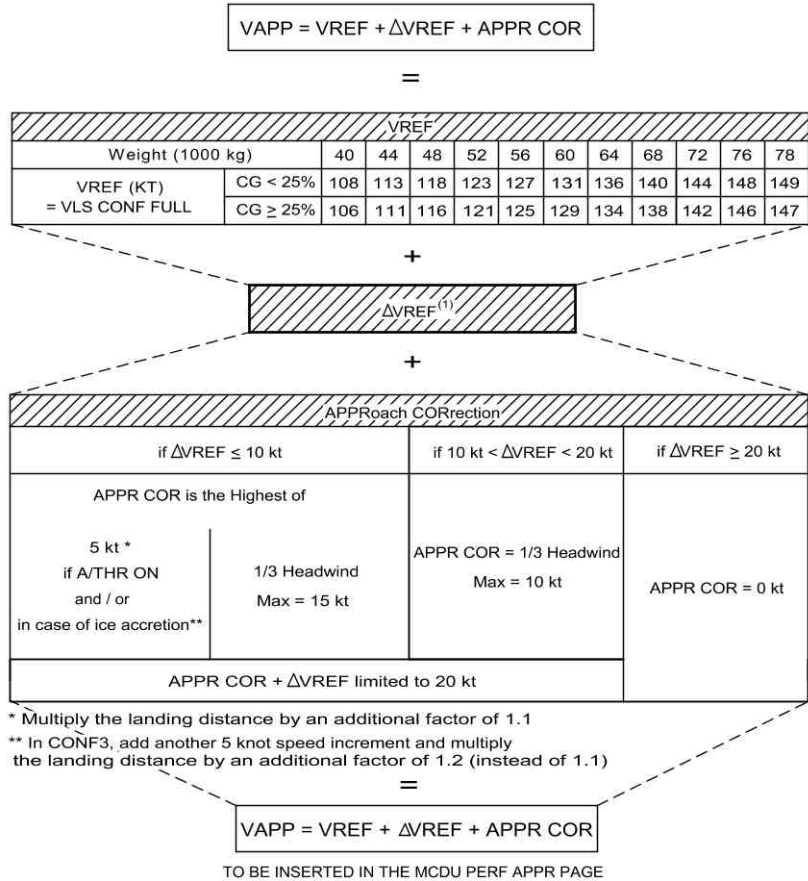

**ECAM ADVISORY CONDITIONS**

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <b>ENG</b> OIL LO PR warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> <p>In both cases, monitor other engine parameters, especially oil temperature and oil quantity.</p>
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	<p>An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.</p> <p><b>Note:</b> If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</p> <p>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</p> <ol style="list-style-type: none"> <li>1. <i>Low Speed</i>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <i>High Speed</i>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

# VAPP CALCULATION

## VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

### EXAMPLE OF VAPP CALCULATION:

- Failure

:

ALTN LAW
- Flight Conditions

:

Autothrust ON, ice accretion
- Landing Configuration

:

CONF 3
- Headwind

:

12 kt
- Landing Weight/CG

:

48 t/25 %
- VREF determined from the landing weight

:

116 kt
- VREF correction due to the failure (ΔVREF)

:

10 kt

As ΔVREF is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- 5+5 = 10 kt (ice accretion and landing in CONF 3)
- 1/3 Headwind = 12 kt/3 = 4 kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

VAPP = VREF + ΔVREF + APPR CORR = 116 + 10 + 10 = 136 kt

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.15</b> 30 MAR 12
-----------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	---------------------------

## USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors** “WITHOUT REV” when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors** “WITH REV” when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note:     *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### **LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE**

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### **LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES**

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column (“WITH REV.” or “WITHOUT REV.”)
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
RESULT	3	10			1.40×1.90×1.1=3.00

VREF = 131 kt. Therefore VAPP = 131 + 10 + 5 = 146 kt.

 <div>DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK</div>		<b>ABNORMAL AND EMERGENCY PROCEDURES</b>			<b>80.15A</b>
					30 MAR 12
FAILURES	Flaps Lever Position for Landing	Δ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S ≥ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b>
		30 MAR 12

<b>TRIPPED C/B RE-ENGAGEMENT</b>
----------------------------------

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.20</b>  30 MAR 12
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

### COMPUTER RESET

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor.

The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>
----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	CP-LVO <b>2/2</b>
		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |
|------------------------------------------------|--------------------------------|
| - α Floor                                      | - Engine Failure               |
| - Autopilot OFF                                | - No 'LAND' green by 350 ft RA |
| - Downgrade below required approach capability | - Autoland warning light       |
| - Amber Caution                                | - No "Flare" by 30 ft          |

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

Intentionally left blank

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	<b>CP-AWO</b> <b>2/2</b> 30 MAR 12

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
BEFORE TAKEOFF Checklist	

## CONTAMINATED RUNWAY OPERATIONS

### ● TAKEOFF

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

### ● MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note: The maximum crosswind values are given without gust.

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

**LANDING DISTANCE WITHOUT AUTOBRAKE - CONF 3**

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		730	760	800	840	890	970	1060	1160	1250
	WET		970	1040	1110	1180	1260	1340	1420	1500	1580
	COVERED WITH	STANDING WATER	1270	1360	1440	1560	1690	1810	1940	2070	2180
		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600
CORRECTION ON ACTUAL LANDING DISTANCE											
RUNWAY CONDITION	dry runway	wet runway	runway covered with								
			standing water	slush		compacted snow		ice			
per 1 000 ft above SL	+3 %	+4 %	+4 %		+5 %		+4 %		+5 %		
per 10 kt headwind	No correction for headwind due to wind correction on approach speed										
per 10 kt tailwind	+17 %	+21 %	+24 %		+22 %		+16 %		+24 %		
forward C.G.	+2 %	+3 %	+3 %		+3 %		+3 %		+3 %		
2 reversers operative	-5 %	-12 %	-15 %		-14 %		-12 %		-27 %		
Per 5 kt speed increment (and no failure) add 8 % (all runways)											

*Note:*    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

**EXAMPLE:** Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
 Pressure altitude = 2 000 ft  
 Approach speed = VLS + 5 kt  
 Dry runway

Read from ALD table,  
 ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
 Pressure altitude correction: 3 × 2 = +6 %  
 Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 × 1.06 × 1.08 = 1 020 m.

**LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL**

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

## COST INDEX FOR LONG RANGE CRUISE SPEED

### ALL ENGINES

For a quick determination of the  $CI_{LRC}$ , use:

-  $CI_{LRC} = 40$  kg/min in the FMGC.

or

-  $CI_{LRC} = 55$  (100 lb/h) in the FMGC.

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEL condition). The flight crew must still compute and monitor the actual fuel consumption.

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times \text{FPF}$$

This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$

This additional fuel must be added to the fuel predictions provided by the FMS.

Note: Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:

- Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or
- If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

$\text{FPF (HYD G SYS LO PR)} = 10 \%$

$\text{FPF (INOP SYS: L AIL)} = 8 \%$

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (10 \% + 8 \%)$

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times 8 \%$

	G+B SYS LO PR	L+R AIL SPLR 1+3+5 L ELEV	Both ailerons are failed Spoilers 1, 3 and 5 See Left elevator is failed RAT is extended	10 % to 15 % See
	G+Y SYS LO PR	SPLR 1+2+4+5 STABILIZER	Stabilizer is jammed Spoilers 1, 2, 4 and 5 See	0 % to 10 % See
	B+Y SYS LO PR	SPLR 2+3+4 R ELEV	Spoilers 2, 3 and 4 See Right elevator is failed RAT extended	3 % to 10 % See
L/G	SHOCK ABSORBER FAULT	L/G RETRACT	All landing gears are extended (Also refer to PRO-SPO-25-10)	180 %
	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT	L/G DOOR	All landing gears doors are extended	15 %
	DOORS NOT CLOSED			

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b> 30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

## FUEL PENALTY FACTORS/INOP SYS TABLE

SYS	INOP SYS	CONDITIONS	FUEL PENALTY FACTOR

	RUDDER TRAVEL LIMIT SYSTEM	1 required for autoland with crosswind higher than 12 kt		
	WINDSHIELD HEAT (L or R windshield)	1 for PF		
	WINDSHIELD WIPERS OR RAIN REPELLENT (if activated)	1 for PF		
	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
	ATTITUDE INDICATION (STBY )	1	1	1
	DH INDICATION	1 for PNF		

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an **ENG 1(2) OIL FILTER CLOG** ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-11		"ENG 1(2) OIL FILTER CLOG" ECAM Caution During Flight	00013213.0001001	30 MAR 12
Criteria: V2500-A5 Applicable to: B-HSD					

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side)..... OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side)..... OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED..... OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER..... IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note: *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

# OEB30 Issue 1.0

## NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:** This OEB replaces the A320 OEB 188.  
 One Operator reported a case where the flight crew initiated a Go Around slightly below the Minimum Descent Altitude (MDA), and the aircraft did not pitch up as expected. The flight crew performed a non precision approach (a VORDME approach) using the FINAL APP managed guidance mode with the AP1 (Autopilot) engaged during the final approach.  
 This OEB is issued to provide flight crews with an operational procedure to avoid such aircraft behavior.  
 The operational procedure provided in this OEB applies to all Non Precision Approaches, for both conventional approaches and RNAV approaches, flown in FINAL APP managed guidance mode.

**Applicable to:** All A318/A319/A320/A321 aircraft

**Cancelled by:** Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.  
 Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-30		No SRS Engagement During Go Around Below MDA	00013527.0002001	30 MAR 12
Criteria: SA Applicable to: B-HSD					

## NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

### ECAM ENTRY

None

### PROCEDURE

During a non precision approach, when using the FINAL APP managed guidance mode:

- **At DA(DH) or MDA(MDH), or earlier in approach if visual conditions are obtained:**

DISENGAGE the FINAL APP mode by pressing the APPR pushbutton on the FCU.

When the flight crew presses the APPR pb in order to disengage the FINAL APP managed guidance mode, a basic vertical guidance mode, either V/S or FPA, engages.

This ensures that the SRS and GA TRK guidance modes correctly engage, if the flight crew initiates a go-around slightly below MDA (MDH).

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

## OEB38 Issue 1.0

# ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

\*\*\*\*\* END OF RED OEB38 ISSUE 1.0 \*\*\*\*\*

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

### ECAM ENTRY

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

### PROCEDURE

Apply the corresponding procedures if one of the following ECAM caution is triggered:

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

#### AIR ENG 1(2) BLEED ABNORMAL PR

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED page.....SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

##### ■ If Wing Anti-Ice is ON

##### ● If both PACKS are ON

PACK (affected bleed side).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

#### AIR ENG 1(2) BLEED FAULT

ENG BLEED affected..... OFF

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

# AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT (Cont'd)

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
 PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

■ If Wing Anti-Ice is ON

- If both PACKS are ON  
 PACK (affected bleed side).....OFF

X BLEED..... OPEN  
 BLEED Page..... SELECT and MONITOR

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
 BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

## OEB43 Issue 2.0 F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:**

All A318/A319/A320/A321 Aircrafts.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF

*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10

*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED

*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

**F/CTL SPOILER FAULT (Cont'd)**

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above VFE<sub>NEXT</sub>, the flight crew should deselect A/THR, decelerate to VFE<sub>NEXT</sub>, and select CONF 1 when below VFE<sub>NEXT</sub>. When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD.....VREF + 10KT

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers..... x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

## OEB44 Issue 2.0

# L/G GEAR NOT DOWNLOCKED

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 209.

This OEB is issued to provide operational recommendations in the case of L/G GEAR NOT DOWNLOCKED ECAM warning.

The illustration has been revised to improve the quality and the legibility.

**Applicable to:**

All A320 family aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

IMPORTANT

**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

**TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

**PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

**PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

**Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

**ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

**ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

		30 MAR 12

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>GENERAL</b>	<b>GEN.03</b> 30 MAR 12

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

00, 01, 02, ...	:	Numbering for ABN, GEN, OPS, OEB PROC sections
01A, 03B, ...	:	Numbering and index (A, B, ...) for procedures written on several paper pages
1/10, 3/5, ...	:	Numbering for NP-NP, FPE-SPO
C1, C2	:	Index of the back cover page interior
C3	:	Index of the back cover page exterior
"BLANK"	:	Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page)

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

		30 MAR 12

Intentionally left blank

## LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The "CAB PR LDG ELEV FAULT" message is displayed on the ECAM
- A "MAP NOT AVAIL" message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### ■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:

#### ● When the system has recovered:

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### ■ DESCENT (IF TIME PERMITS) :

#### ● When the system has recovered:

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

The method for approach speed computation is given in the QRH ABN 80 (Refer to VAPP Calculation).

FLT ON BAT ONLY

Flight time on batteries only may be increased to at least 30 min as follows:

ENG MODE SEL..... NORM

ANTI ICE PITOT 1 C/B (D02)..... PULL

26 V ADIRU 1 C/B (F07).....PULL

*CM 1 altitude, speed, and vertical speed indication on PFD are lost. Use standby instruments*

● **7 min before landing:**

ANTI ICE PITOT 1 C/B (D02)..... RESET

● **After 1 min:**

<b>CAUTION</b>	This time delay is necessary to ensure reliable speed information even in icing conditions when the ADIRU is reset to ON.
----------------	---------------------------------------------------------------------------------------------------------------------------

26 V ADIRU 1 C/B (F07).....RESET

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● If one or more electrical latches (strikes) are faulty:

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● If two pressure sensors are faulty:

Automatic latch release is not available, in case of cockpit decompression.

● If no LED on the CKPT DOOR CONT panel is on:

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

### ■ Repeat the following until landing configuration is reached:

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered. In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.

### ● As speed reduces through VFE NEXT:

FLAPS LEVER..... ONE STEP DOWN

### ■ When landing configuration is established:

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

### ■ IF SLATS FAULT:

#### ● FOR CIRCUIT:

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

#### ● FOR DIVERSION

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

### ■ IF FLAPS FAULT:

#### ● FOR CIRCUIT:

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

#### ● FOR DIVERSION:

##### ● If FLAPS jammed at 0

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

Note:

- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
- In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED

Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
Slats					
S = 0	NO LIMITATION	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1	230 kt				177 kt
S = 1					
1 < S ≤ 3	200 kt		200 kt	185 kt	
S > 3	177 kt		177 kt	177 kt	177 kt

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>
		30 MAR 12

Intentionally left blank

**SIDESTICK/RUDDER PEDALS STIFF**

Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:

- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or
- One sidestick and the rudder pedals at the same time.

The piloting technique remains the same: The aircraft remains responsive.  
However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.

AP DISENGAGEMENT..... CONFIRM

CONSIDER TRANSFERRING CONTROL TO PNF

- **FOR DECRAB, ROLLOUT, OR ENGINE FAILURE**  
BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

# STABILIZER JAM

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
 The flight control normal law remains active in this case and there is no ECAM warning.

AP..... OFF  
 MAN PITCH TRIM.....CHECK

*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

**● IF MAN TRIM AVAIL:**

TRIM FOR NEUTRAL ELEV

*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

**APPR PROC**

**● IF MAN TRIM NOT AVAIL:**

FOR LDG.....USE FLAP 3

*Do not select configuration full so as not to degrade the handling qualities.*

GPWS LDG FLAP 3..... ON

CAT 2 INOP

<b>FUEL IMBALANCE</b>
-----------------------

FOB..... CHECK  
*Compare the FOB + FU, with the FOB at departure.*  
*If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.*

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. <i>Refer to ABN-28 FUEL LEAK.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON  
 ● **On the lighter side and in the center tank:**  
     FUEL PUMPS.....OFF  
 ● **When fuel is balanced:**  
     FUEL PUMPS (WING + CTR)..... ON  
     FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>28.02A</b>
		30 MAR 12

**FUEL LEAK (Cont'd)**

ENGINE RESTART..... CONSIDER

<b>CAUTION</b>	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.
----------------	----------------------------------------------------------------------------------------------------------------------

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

- **If fuel smell in the cabin:**  
 APU (if ON)..... OFF  
*This prevents additional fuel loss through the APU feeding line.*
- **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**  
 CTR TK PUMP 1+2..... ON

**FOR LANDING**

<b>CAUTION</b>	Do not use reversers.
----------------	-----------------------

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or diagonal line),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, Upper ECAM or MCDU 1 is(are) affected.

GEN 1.....OFF

#### ■ If DUs do not stop flashing:

GEN 1..... ON

#### ■ If DUs stop flashing:

GEN 1.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2.....OFF

#### ■ If DUs do not stop flashing:

GEN 2..... ON

#### ■ If DUs stop flashing:

GEN 2.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ AFFECTED DU IS BLANK or the DISPLAY IS DISTORTED:

DU (affected).....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected)..... USE

*Transfer SD to F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected).....USE

### ■ DIAGONAL LINE ON THE AFFECTED DU:

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

EIS DMC SWITCHING..... AS RQRD

DISPLAY UNIT FAILURE (Cont'd)

- **If unsuccessful:**  
DU (affected)..... OFF THEN ON  
  
*Note:     The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
- **INVERSION OF THE EWD AND THE SD:**  
ECAM UPPER DISPLAY .....OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

LOSS OF BRAKING

- IF NO BRAKING AVAILABLE:  
REV ..... MAX  
BRAKE PEDALS..... RELEASE  
A/SKID & N/W STRG..... OFF  
BRAKE PEDALS..... PRESS  
MAX BRK PR..... 1000 PSI
- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <b>WHEEL SD</b> page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <u>L/G</u> GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**PREPARATION**

- CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF  
*Consider fuel reduction to a safe minimum.*
- **If NOSE L/G abnormal:**  
 CG location (if possible).....AFT
    - 10 passengers from front to rear moves the CG roughly 4 % aft.
    - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.
  - **If one MAIN L/G abnormal:**  
 FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*
- OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE
 
  - Loose equipment secured.
  - Survival equipment prepared.
  - Belts and shoulder harness locked.

**APPROACH**

- GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI
- **If one or both MAIN L/G abnormal:**  
 GROUND SPOILERS.....DO NOT ARM

**BEFORE LANDING**

- RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER
- **If the external light condition is poor at landing:**  
 DOME LT.....DIM

**FLARE, TOUCH DOWN AND ROLL OUT**

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.

Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

## LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

● **If NOSE L/G abnormal:**

NOSE..... MAINTAIN UP

*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*

BRAKES (compatible with elevator efficiency)..... APPLY

ENG MASTERS..... OFF

*Shutdown the engines before nose impact.*

● **If one MAIN L/G abnormal:**

ENG MASTERS..... OFF

*At touchdown, shut down both engines.*

FAILURE SIDE WING..... MAINTAIN UP

*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*

DIRECTIONAL CONTROL..... MAINTAIN

*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

● **If both MAIN L/G abnormal:**

ENG MASTERS..... OFF

*Shut down the engines in the flare, before touchdown.*

PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

### WHEN A/C STOPPED

ENG (all) and APU FIRE pushbutton..... PUSH

*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*

ENG (all) and APU AGENT..... DISCH

■ **If Evacuation required:**

EVACUATION..... INITIATE

- All emergency and passenger doors may be used to evacuate the aircraft.

- Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

■ **If Evacuation not required:**

CABIN CREW and PASSENGERS (PA)..... NOTIFY

*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>34.02</b>
		30 MAR 12

Intentionally left blank

NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 °,
- 0.9 min for latitudes at or above 55 ° and below 70 °,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

- **If the message occurs during ILS/LOC approach (LOC green):**  
DISREGARD it.
- **If the message occurs in climb, cruise, or descent:**  
CHECK navigation accuracy, using raw data.
  - **If the check is positive:**  
NAV mode and ND ARC/ROSE NAV may be used.
  - **If the check is negative:**  
HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

- **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**  
Use the associated FD/AP.
- **If not:**  
Deselect GPS and revert to basic information.
- **If the message occurs during a Non Precision Approach (NPA):**
  - **Overlay approach:**  
SELECT HDG, or TRK, and use raw data.
  - **GPS or RNAV approach:**  
GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.  
During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

## IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
*ALIGN light on during 30 s.*  
*ATT MODE displayed on CDU.*
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

Depending on the CDU keyboard installed, an “H” may be written on the “5” key:

- If “H” is written on the “5” key:  
 H KEY..... PRESS  
*Degree marker, 0 decimal point, ENT and CLR lights come on.*  
 A/C HEADING..... ENTER
- If “H” is not written on the “5” key:  
 A/C HEADING..... ENTER  
*Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.*  
*Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.*  
*Heading will be displayed on the associated ND.*  
*“HDG-ATT MODE” will be displayed on CDU.*

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and  $V_{MAX}$ .*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

**FLYING TECHNIQUE TO STABILIZE SPEED :**

Adjust pitch in order to fly the required flight path.

When target pitch is reached, flying intended flight path, adjust thrust to target:

*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*

*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

**WHEN FLIGHT PATH IS STABILIZED**

PROBE/WINDOW HEAT.....ON

**TECHNICAL RECOMMENDATIONS:**

- Respect Stall Warning
- To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:
  - Do not use FPV and/or V/S, which are affected.
  - ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s)..... OFF  
 REMAINING AIR DATA..... CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR..... KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs..... OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF..... USE FLAP 3

APP SPD..... VLS +10

LDG DIST PROC..... APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST..... CLB

FLAPS..... RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

      - LDG DIST PROC..... APPLY
      - Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

ENG DUAL FAILURE - FUEL REMAINING

As long as none of the engines recover, the flight crew should apply this paper procedure and then, if time permits, clear ECAM alerts and check the ECAM. STATUS page.

LAND ASAP

ENG MODE SEL.....IGN  
THRUST LEVERS.....IDLE  
OPTIMUM RELIGHT SPD.....280 KT

Note: In the case of an “ENG DUAL FAILURE” during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.

In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).

LANDING STRATEGY.....DETERMINE  
Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.

EMER ELEC PWR.....MAN ON  
VHF1/HF1 /ATC1.....USE  
ATC.....NOTIFY  
FAC 1.....OFF THEN ON  
Resetting FAC 1 also enables rudder trim recovery, even if no indication is available.

- IF NO RELIGHT AFTER 30 SEC:  
ENG MASTERS.....OFF 30 S/ON  
Unassisted start attempts can be repeated until successful, or until APU bleed is available.  
CREW OXY MASKS (Above FL 100).....ON

- WHEN APU AVAIL FL < 200:  
WING ANTI ICE.....OFF  
APU BLEED.....ON  
ENG MASTERS (one at a time).....OFF 30 S/ON

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS..... ON  
GALLEY..... OFF  
USE RUDDER WITH CARE

● WHEN BELOW FL 150  
RAM AIR..... ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100)..... OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.  
MIN APPR SPEED..... 150 KT  
VAPP..... DETERMINE  
Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

● At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):

● When in CONF 3 and VAPP:  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.

● When L/G downlocked  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).

GND SPLR..... ARM  
MAX BRK PR..... 1000 PSI

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION	External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :
---------	---------------------------------------------------------------------------------------------------------------------------------------------

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

- When burning has stopped :  
MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1  $\geq$  5 units, N2  $\geq$  5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0
5	70.0	69.0	68.0	67.0	65.0	64.0	60.0	55.0
10	70.0	69.0	68.0	67.0	65.0	61.0	57.0	52.0
15	70.0	69.0	68.0	66.0	63.0	59.0	54.0	50.0
20	70.0	69.0	66.0	64.0	61.0	56.0	52.0	48.0
25	70.0	67.0	64.0	62.0	58.0	54.0	50.0	46.0

40	62.0	60.0	58.0	54.0				
45	59.0	57.0	55.0					
50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE
<i>Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.</i>	
NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN
<i>Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.</i>	
DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

## BOMB ON BOARD (Cont'd)

- **When at CAB ALT+2 500 ft:**
  - 1 PSI DELTA P..... MAINTAIN
  - GALLEY..... OFF
  - FLAPS (fuel permitting)..... AT LEAST CONF 1
  - For landing, use normal configuration.*
  - LANDING GEAR (fuel permitting, except for flight over water)..... DOWN
- **For any other steps of descent:**
  - 1 PSI DELTA P..... MAINTAIN
- **During approach:**
  - CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**
    - EVACUATION..... INITIATE
    - Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**
    - CABIN CREW and PASSENGERS (PA)..... NOTIFY

### **CABIN PROCEDURES**

If a suspect device is found in the cabin:

<b>WARNING</b>	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
<b>WARNING</b>	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
<b>CAUTION</b>	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

**EOD PERSONNEL ON BOARD..... CHECK**

*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

**BOMB..... DO NOT OPEN**

**BOMB..... DO NOT CUT WIRES**

**BOMB..... SECURE AGAINST SLIPPING**

**BOMB..... AVOID SHOCKS**

*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

**PASSENGERS..... LEAD AWAY FROM BOMB**

*Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*

*Seat backs and tray tables must be in their full upright position.*

*Service items may need to be collected in order to secure tray tables.*

**PORTABLE ELECTRONIC DEVICES..... SWITCH OFF**

*The cabin crews must command passengers to switch off all portable electronic devices.*

## BOMB ON BOARD (Cont'd)

### BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

### EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

### GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

#### ● If the bomb can be moved:

#### RH AFT CABIN DOOR SLIDE.....DISARM

#### LEAST RISK BOMB LOCATION (LRBL).....PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

### BOMB INDICATION LINE.....POSITION

Note: A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m ) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

### BOMB.....MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

**CAUTION** Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

### LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

*Build up at 25 cm (10 in ) of wetted material around the sides and on top of the bomb.*

## BOMB ON BOARD (Cont'd)

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

### **PASSENGERS.....MOVE/ADVISE**

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

### **CABIN CREW..... NOTIFY COCKPIT CREW**

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

### **EVACUATION/DISEMBARKATION.....EXECUTE**

*Evacuate through normal and emergency exits on the opposite side of the "bomb" location. Do not use the door just opposite the "bomb".*

*Use all available airport facilities to disembark without delay.*

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.03</b>  30 MAR 12

		30 MAR 12
FORCED LANDING (Cont'd)		
<div>■ If Evacuation not required: CABIN CREW and PASSENGERS (PA)..... NOTIFY</div>		

## EMER DESCENT

### IMMEDIATE ACTION

CREW OXY MASKS..... ON  
EMER DESCENT.....ANNOUNCE(PA)

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS..... ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

#### CAUTION

*Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.*

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note: *The recommendation is to descend with the autopilot engaged.  
Use of the autopilot is also permitted in EXPEDITE mode .*

ENG MODE SEL.....IGN

ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note: *Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● In the final approach stages

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.  
Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

REVERSE THRUST..... USE MAX AVAILABLE

● After nosewheel touchdown

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58

35	83	81	76	70	65			
40	83	80	73	67				
45	82	76	70					
50	79	73						
55								

## STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

**NOSE DOWN PITCH CONTROL..... APPLY**

*This will reduce angle of attack*

Note: In case of lack of pitch down authority, reducing thrust may be necessary.

**BANK..... WINGS LEVEL**

● **When out of stall (no longer stall indications) :**

**THRUST..... INCREASE SMOOTHLY AS NEEDED**

Note: In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

**SPEEDBRAKES..... CHECK RETRACTED**

**FLIGHT PATH..... RECOVER SMOOTHLY**

● **If in clean configuration and below 20 000 ft:**

**FLAP 1..... SELECT**

Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

## STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

**THRUST..... TOGA**

At the same time:

**PITCH ATTITUDE..... 15 °**

**BANK..... WINGS LEVEL**

Note: When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

TAILSTRIKE

In the event of a tailstrike, apply the following procedure:

LAND ASAP

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.*  
*Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

## VOLCANIC ASH ENCOUNTER

● **If the aircraft enters a volcanic ash cloud:**

180 ° TURN..... INITIATE  
ATC..... NOTIFY  
A/THR..... OFF  
THRUST (conditions permitting).....REDUCE  
CREW OXYGEN MASKS.....ON/100 %/EMER  
CABIN CREW.....NOTIFY  
PASSENGER OXYGEN.....AS RQRD  
ENG ANTI ICE..... ON  
WING ANTI ICE..... ON  
PACK FLOW..... HI

Note: If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

APU..... START  
ENGINE PARAMETERS..... MONITOR  
AIRSPEED INDICATIONS.....MONITOR

If airspeed is unreliable or lost, Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.

Note: If all engines flame out and speed indications are lost, Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

Note: If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

CAB PRESS MODE SEL..... MAN  
MAN V/S CTL..... FULL UP

Due to the increased noise level, pay particular attention to visual warnings.

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ At takeoff

#### ■ If before V1

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ If after V1

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA..... SET OR CONFIRM  
 AP (if engaged)..... KEEP  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

**DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.**

**CLOSELY MONITOR FLIGHT PATH AND SPEED.**

**RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.**

<b>WINDSHIELD/WINDOW ARCING</b>
---------------------------------

Affected WINDOW/WINDSHIELD ANTI ICE C/B..... PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

## WINDSHIELD/WINDOW CRACKED

DIAGNOSIS OF INNER PLY.....PERFORM  
*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation

*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

MAX FL..... 230/MEA

*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain  $\Delta P$  5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note:    *The following procedure allows maintaining  $\Delta P$  5 PSI in manual cabin pressure mode.*

CAB PRESS MODE SEL..... MAN

MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

$\Delta P = 5$ PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

CAB PRESS MODE SEL..... AUTO

Note:    *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

CAB PRESS MODE SEL..... MAN

MAN V/S CTL..... FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

**ECAM ADVISORY CONDITIONS**

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <b>ENG</b> OIL LO PR warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> <p>In both cases, monitor other engine parameters, especially oil temperature and oil quantity.</p>
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	<p>An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.</p> <p><u>Note:</u> If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</p> <p>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</p> <ol style="list-style-type: none"> <li>1. <u>Low Speed</u>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <u>High Speed</u>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

## VAPP CALCULATION

### VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

\* Multiply the landing distance by an additional factor of 1.1

\*\* In CONF3, add another 5 knot speed increment and multiply the landing distance by an additional factor of 1.2 (instead of 1.1)

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

#### EXAMPLE OF VAPP CALCULATION:

Failure : ALTN LAW  
 Flight Conditions : Autothrust ON, ice accretion  
 Landing Configuration : CONF 3  
 Headwind : 12 kt  
 Landing Weight/CG : 48 t/25 %  
 VREF determined from the landing weight : 116 kt  
 VREF correction due to the failure ( $\Delta VREF$ ) : 10 kt

As  $\Delta VREF$  is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- 5+5 = 10 kt (ice accretion and landing in CONF 3)
- 1/3 Headwind = 12 kt/3 = 4 kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

$VAPP = VREF + \Delta VREF + APPR CORR = 116 + 10 + 10 = 136$  kt

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 24pt; font-weight: bold;">80.15</div> <div style="text-align: center;">30 MAR 12</div>
-----------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------

## USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors** “WITHOUT REV” when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors** “WITH REV” when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note:     *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column (“WITH REV.” or “WITHOUT REV.”)
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
RESULT	3	10			1.40×1.90×1.1=3.00

VREF = 131 kt. Therefore VAPP = 131 + 10 + 5 = 146 kt.

 <div>DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK</div>		<b>ABNORMAL AND EMERGENCY PROCEDURES</b>			<b>80.15A</b>
					30 MAR 12
FAILURES	Flaps Lever Position for Landing	Δ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S ≥ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

<sup>(a)</sup> Multiply the LDG DIST factors by the Actual Landing Distance CONTA without Autobrake - configuration FULL - without any reversers correction. Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL

<sup>(b)</sup> Flaps FULL and Flaps 3 are both acceptable positions. Flaps FULL is recommended, but the flight crew may use Flaps 3, if necessary, for operational reasons.

<sup>(c)</sup> In case of dispatch with one or more reverser(s) inoperative, use the LDG DIST factors "WITHOUT REV.", whatever the actual thrust reversers selection at landing.

<sup>(d)</sup> The applicable landing configuration (CONF 1 or CONF 3) is displayed on the ECAM STATUS page.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b> 30 MAR 12
----------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	---------------------------

## TRIPPED C/B RE-ENGAGEMENT

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.20</b>  30 MAR 12
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

### COMPUTER RESET

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor.

The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	COMPANY PROCEDURES	CP-LVO <b>2/2</b>
		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
BEFORE TAKEOFF Checklist	

## CONTAMINATED RUNWAY OPERATIONS

### ● TAKEOFF

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

### ● MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note: The maximum crosswind values are given without gust.

		30 MAR 12

Intentionally left blank

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600

CORRECTION ON ACTUAL LANDING DISTANCE						
RUNWAY CONDITION	dry runway	wet runway	runway covered with			
			standing water	slush	compacted snow	ice
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %
per 10 kt headwind	No correction for headwind due to wind correction on approach speed					
per 10 kt tailwind	+17 %	+21 %	+24 %	+22 %	+16 %	+24 %
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+3 %
2 reversers operative	-5 %	-12 %	-15 %	-14 %	-12 %	-27 %
Per 5 kt speed increment (and no failure) add 8 % (all runways)						

Note:    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
Pressure altitude = 2 000 ft  
Approach speed = VLS + 5 kt  
Dry runway

Read from ALD table,  
ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
Pressure altitude correction: 3 × 2 = +6 %  
Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 × 1.06 × 1.08 = 1 020 m.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)

## COST INDEX FOR LONG RANGE CRUISE SPEED

### ALL ENGINES

For a quick determination of the  $CI_{LRC}$ , use:

- $CI_{LRC} = 40$  kg/min in the FMGC.
- or
- $CI_{LRC} = 55$  (100 lb/h) in the FMGC.

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEL condition). The flight crew must still compute and monitor the actual fuel consumption.

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times \text{FPF}$$

This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$

This additional fuel must be added to the fuel predictions provided by the FMS.

Note: Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:

- Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or
- If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

FPF (HYD G SYS LO PR) = 10 %

FPF (INOP SYS: L AIL) = 8 %

Therefore, ADDITIONAL FUEL = (FOB - EFOD at DEST) x (10 % + 8 %)

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore, ADDITIONAL FUEL = (FOB - EFOD at DEST) x 8 %

	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT	L/G DOOR	All landing gears doors are extended	15 %
	DOORS NOT CLOSED			

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b>
		30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

<b>FUEL PENALTY FACTORS/INOP SYS TABLE</b>
--------------------------------------------

	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
	ATTITUDE INDICATION (STBY )	1	1	1
DH INDICATION	1 for PNF			

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:**
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an **ENG 1(2) OIL FILTER CLOG** ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

Criteria: V2500-A5 Applicable to: B-HSE					

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side).....OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side).....OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED.....OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER.....IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note:     *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

# OEB30 Issue 1.0

## NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:** This OEB replaces the A320 OEB 188.  
 One Operator reported a case where the flight crew initiated a Go Around slightly below the Minimum Descent Altitude (MDA), and the aircraft did not pitch up as expected. The flight crew performed a non precision approach (a VORDME approach) using the FINAL APP managed guidance mode with the AP1 (Autopilot) engaged during the final approach.  
 This OEB is issued to provide flight crews with an operational procedure to avoid such aircraft behavior.  
 The operational procedure provided in this OEB applies to all Non Precision Approaches, for both conventional approaches and RNAV approaches, flown in FINAL APP managed guidance mode.

**Applicable to:** All A318/A319/A320/A321 aircraft

**Cancelled by:** Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.  
 Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

<div> DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK</div>			OPERATIONS ENGINEERING BULLETINS		30.00A
					30 MAR 12

	OEBPROC-30		No SRS Engagement During Go Around Below MDA	00013527.0002001	30 MAR 12
Criteria: SA Applicable to: B-HSE					

## NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

### ECAM ENTRY

None

### PROCEDURE

During a non precision approach, when using the FINAL APP managed guidance mode:

- **At DA(DH) or MDA(MDH), or earlier in approach if visual conditions are obtained:**

DISENGAGE the FINAL APP mode by pressing the APPR pushbutton on the FCU.

When the flight crew presses the APPR pb in order to disengage the FINAL APP managed guidance mode, a basic vertical guidance mode, either V/S or FPA, engages.

This ensures that the SRS and GA TRK guidance modes correctly engage, if the flight crew initiates a go-around slightly below MDA (MDH).

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: SA Applicable to: B-HSE				
	OEBPROC-31		Erroneous Vertical Profile During RNAV, LOC and LOC B/C Approaches	00013531.0003001	30 MAR 12
	Criteria: SA Applicable to: B-HSE				

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

## OEB38 Issue 1.0

# ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: SA Applicable to: B-HSE				

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

\*\*\*\*\* END OF RED OEB38 ISSUE 1.0 \*\*\*\*\*

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## OEB43 Issue 2.0

### F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:**

All A318/A319/A320/A321 Aircrafts.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF  
*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10  
*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED  
*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

F/CTL SPOILER FAULT (Cont'd)

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above  $V_{FE_{NEXT}}$ , the flight crew should deselect A/THR, decelerate to  $V_{FE_{NEXT}}$ , and select CONF 1 when below  $V_{FE_{NEXT}}$ . When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD.....VREF + 10KT

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers..... x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

## OEB44 Issue 2.0

### L/G GEAR NOT DOWNLOCKED

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 209.

This OEB is issued to provide operational recommendations in the case of L/G GEAR NOT DOWNLOCKED ECAM warning.

The illustration has been revised to improve the quality and the legibility.

**Applicable to:**

All A320 family aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## L/G GEAR NOT DOWNLOCKED

### ECAM ENTRY

L/G GEAR NOT DOWNLOCKED

### PROCEDURE

Apply the following procedure if the ECAM triggers the L/G GEAR NOT DOWNLOCKED warning:

#### L/G GEAR NOT DOWNLOCKED

*This warning appears, if the landing gear sequence is not completed after 30 seconds.*

L/G lever.....RECYCLE

•IF GEAR NOT DOWNLOCKED AFTER 2 MINUTES:

L/G GRAVITY EXTENSION PROC.....APPLY

STATUS

The status displayed on the ECAM is correct.

IMPORTANT

**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

**TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

**PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

**PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

**Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

**ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

**ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>GENERAL</b>	<b>GEN.03</b> 30 MAR 12

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

- |                 |   |                                                                                                                                 |
|-----------------|---|---------------------------------------------------------------------------------------------------------------------------------|
| 00, 01, 02, ... | : | Numbering for ABN, GEN, OPS, OEB PROC sections                                                                                  |
| 01A, 03B, ...   | : | Numbering and index (A, B, ...) for procedures written on several paper pages                                                   |
| 1/10, 3/5, ...  | : | Numbering for NP-NP, FPE-SPO                                                                                                    |
| C1, C2          | : | Index of the back cover page interior                                                                                           |
| C3              | : | Index of the back cover page exterior                                                                                           |
| "BLANK"         | : | Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page) |

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

## CABIN OVERPRESSURE

Apply the following procedure (not displayed on ECAM) in case of total loss of the cabin pressure control leading to overpressure

PACK 1 or 2..... OFF

BLOWER + EXTRACT..... OVRD

*Cabin air is extracted overboard.*

$\Delta P$ ..... FREQUENTLY MONITOR

● **If  $\Delta P > 9$  PSI**

PACK 1+2..... OFF

**LAND ASAP**

Before 10 min from landing:

PACK 1+2..... OFF

BLOWER + EXTRACT..... AUTO

**CAUTION**

Check that  $\Delta P$  is zero before opening the doors.

		30 MAR 12

Intentionally left blank

## **LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)**

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The “CAB PR LDG ELEV FAULT” message is displayed on the ECAM
- A “MAP NOT AVAIL” message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### **■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:**

#### **● When the system has recovered:**

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### **■ DESCENT (IF TIME PERMITS) :**

#### **● When the system has recovered:**

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

The method for approach speed computation is given in the QRH ABN 80 (Refer to VAPP Calculation).

FLT ON BAT ONLY

Flight time on batteries only may be increased to at least 30 min as follows:

ENG MODE SEL..... NORM

ANTI ICE PITOT 1 C/B (D02)..... PULL

26 V ADIRU 1 C/B (F07).....PULL

*CM 1 altitude, speed, and vertical speed indication on PFD are lost. Use standby instruments*

● **7 min before landing:**

ANTI ICE PITOT 1 C/B (D02)..... RESET

● **After 1 min:**

<b>CAUTION</b>	This time delay is necessary to ensure reliable speed information even in icing conditions when the ADIRU is reset to ON.
----------------	---------------------------------------------------------------------------------------------------------------------------

26 V ADIRU 1 C/B (F07).....RESET

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
 In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● **If one or more electrical latches (strikes) are faulty:**

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● **If two pressure sensors are faulty:**

Automatic latch release is not available, in case of cockpit decompression.

● **If no LED on the CKPT DOOR CONT panel is on:**

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

■ **Repeat the following until landing configuration is reached:**

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered.  
*In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

● **As speed reduces through VFE NEXT:**

FLAPS LEVER..... ONE STEP DOWN

■ **When landing configuration is established:**

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

■ **IF SLATS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION**

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

■ **IF FLAPS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION:**

● **If FLAPS jammed at 0**

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

Note:

- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
- In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED

Slats	Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
S = 0	NO LIMITATION	230 kt	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1						
S = 1						
1 < S ≤ 3	200 kt		200 kt	185 kt	177 kt	
S > 3	177 kt		177 kt	177 kt	177 kt	

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>
		30 MAR 12

Intentionally left blank

**SIDESTICK/RUDDER PEDALS STIFF**

Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:

- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or
- One sidestick and the rudder pedals at the same time.

The piloting technique remains the same: The aircraft remains responsive.  
However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.

AP DISENGAGEMENT..... CONFIRM  
CONSIDER TRANSFERRING CONTROL TO PNF

- **FOR DECRAB, ROLLOUT, OR ENGINE FAILURE**  
BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

STABILIZER JAM

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
 The flight control normal law remains active in this case and there is no ECAM warning.

AP..... OFF  
 MAN PITCH TRIM.....CHECK

*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

- **IF MAN TRIM AVAIL:**

TRIM FOR NEUTRAL ELEV  
*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

**APPR PROC**

- **IF MAN TRIM NOT AVAIL:**

FOR LDG.....USE FLAP 3  
*Do not select configuration full so as not to degrade the handling qualities.*

GPWS LDG FLAP 3..... ON

CAT 2 INOP

FUEL IMBALANCE

FOB..... CHECK  
*Compare the FOB + FU, with the FOB at departure.  
If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.*

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. <i>Refer to ABN-28 FUEL LEAK.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON

- **On the lighter side and in the center tank:**  
FUEL PUMPS.....OFF
- **When fuel is balanced:**  
FUEL PUMPS (WING + CTR)..... ON  
FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>28.02A</b>
		30 MAR 12

**FUEL LEAK (Cont'd)**

ENGINE RESTART..... CONSIDER

<b>CAUTION</b>	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.
----------------	----------------------------------------------------------------------------------------------------------------------

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

- **If fuel smell in the cabin:**  
 APU (if ON)..... OFF  
*This prevents additional fuel loss through the APU feeding line.*
- **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**  
 CTR TK PUMP 1+2..... ON

**FOR LANDING**

<b>CAUTION</b>	Do not use reversers.
----------------	-----------------------

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or diagonal line),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, Upper ECAM or MCDU 1 is(are) affected.

GEN 1.....OFF

#### ■ If DUs do not stop flashing:

GEN 1..... ON

#### ■ If DUs stop flashing:

GEN 1.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2.....OFF

#### ■ If DUs do not stop flashing:

GEN 2..... ON

#### ■ If DUs stop flashing:

GEN 2.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ AFFECTED DU IS BLANK or the DISPLAY IS DISTORTED:

DU (affected).....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected)..... USE

*Transfer SD to F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected).....USE

### ■ DIAGONAL LINE ON THE AFFECTED DU:

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

EIS DMC SWITCHING..... AS RQRD

DISPLAY UNIT FAILURE (Cont'd)

- **If unsuccessful:**  
DU (affected)..... OFF THEN ON  
  
*Note:*     *The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
- **INVERSION OF THE EWD AND THE SD:**  
ECAM UPPER DISPLAY .....OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

LOSS OF BRAKING

- IF NO BRAKING AVAILABLE:  
REV ..... MAX  
BRAKE PEDALS..... RELEASE  
A/SKID & N/W STRG..... OFF  
BRAKE PEDALS..... PRESS  
MAX BRK PR..... 1000 PSI
- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <u>WHEEL</u> SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <u>L/G</u> GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

**PREPARATION**

- CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF  
*Consider fuel reduction to a safe minimum.*
- **If NOSE L/G abnormal:**  
 CG location (if possible).....AFT
    - 10 passengers from front to rear moves the CG roughly 4 % aft.
    - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.
  - **If one MAIN L/G abnormal:**  
 FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*
- OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE  
 - Loose equipment secured.  
 - Survival equipment prepared.  
 - Belts and shoulder harness locked.

**APPROACH**

- GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI
- **If one or both MAIN L/G abnormal:**  
 GROUND SPOILERS.....DO NOT ARM

**BEFORE LANDING**

- RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER
- **If the external light condition is poor at landing:**  
 DOME LT.....DIM

**FLARE, TOUCH DOWN AND ROLL OUT**

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.  
 Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

## LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

● **If NOSE L/G abnormal:**

NOSE..... MAINTAIN UP

*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*

BRAKES (compatible with elevator efficiency)..... APPLY

ENG MASTERS..... OFF

*Shutdown the engines before nose impact.*

● **If one MAIN L/G abnormal:**

ENG MASTERS..... OFF

*At touchdown, shut down both engines.*

FAILURE SIDE WING..... MAINTAIN UP

*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*

DIRECTIONAL CONTROL..... MAINTAIN

*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

● **If both MAIN L/G abnormal:**

ENG MASTERS..... OFF

*Shut down the engines in the flare, before touchdown.*

PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

### WHEN A/C STOPPED

ENG (all) and APU FIRE pushbutton..... PUSH

*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*

ENG (all) and APU AGENT..... DISCH

■ **If Evacuation required:**

EVACUATION..... INITIATE

- All emergency and passenger doors may be used to evacuate the aircraft.

- Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

■ **If Evacuation not required:**

CABIN CREW and PASSENGERS (PA)..... NOTIFY

*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

Note:     *In case of a go-around, respect maximum speed 215 kt in CONF 1+F, due to the loss of flap auto retraction to CONF 1.*

<b>CAUTION</b>	<i>Check that the outflow valve is fully open, and that cabin altitude is at airfield elevation before opening the doors.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------

<sup>(1)</sup>    *At slats' extension, full rudder travel authority is recovered.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	ABNORMAL AND EMERGENCY PROCEDURES	34.02
		30 MAR 12

Intentionally left blank

**NAV FM / GPS POS DISAGREE**

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 ° ,
- 0.9 min for latitudes at or above 55 ° and below 70 ° ,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

● **If the message occurs during ILS/LOC approach (LOC green):**

DISREGARD it.

● **If the message occurs in climb, cruise, or descent:**

CHECK navigation accuracy, using raw data.

■ **If the check is positive:**

NAV mode and ND ARC/ROSE NAV may be used.

■ **If the check is negative:**

HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

■ **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**

Use the associated FD/AP.

■ **If not:**

Deselect GPS and revert to basic information.

● **If the message occurs during a Non Precision Approach (NPA):**

■ **Overlay approach:**

SELECT HDG, or TRK, and use raw data.

■ **GPS or RNAV approach:**

GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.

During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
 ALIGN light on during 30 s.  
 ATT MODE displayed on CDU.
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

Depending on the CDU keyboard installed, an “H” may be written on the “5” key:

- If “H” is written on the “5” key:
 

H KEY..... PRESS  
 Degree marker, 0 decimal point, ENT and CLR lights come on.

A/C HEADING..... ENTER
- If “H” is not written on the “5” key:
 

A/C HEADING..... ENTER  
 Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.  
 Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.  
 Heading will be displayed on the associated ND.  
 “HDG-ATT MODE” will be displayed on CDU.

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and VMAX.*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s).....OFF  
 REMAINING AIR DATA.....CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR.....KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs.....OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF.....USE FLAP 3

APP SPD.....VLS +10

LDG DIST PROC.....APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST.....CLB

FLAPS.....RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
 THR LEVERS..... IDLE  
 FAC 1.....OFF THEN ON  
 ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.

OPTIMUM RELIGHT SPD.....280 KT

*Note: In the case of an “ENG DUAL FAILURE” during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

*In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:*

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

*At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*

VHF1/HF1  /ATC1.....USE

ATC.....NOTIFY

- **IF NO RELIGHT AFTER 30 SEC:**

ENG MASTERS..... OFF 30 S/ON

*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*

CREW OXY MASKS (Above FL 100).....ON
- **WHEN APU AVAIL FL < 200:**

WING ANTI ICE..... OFF

APU BLEED..... ON

ENG MASTERS (one at a time)..... OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
GALLEY.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
*Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).*

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION

External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

● When burning has stopped :

MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1 ≥ 5 units, N2 ≥ 5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

- Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

- Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0
5	70.0	69.0	68.0	67.0	65.0	64.0	60.0	55.0

45	59.0	57.0	55.0					
50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE

*Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.*

NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN

*Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.*

DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

## BOMB ON BOARD (Cont'd)

- **When at CAB ALT+2 500 ft:**
  - 1 PSI DELTA P..... MAINTAIN
  - GALLEY..... OFF
  - FLAPS (fuel permitting)..... AT LEAST CONF 1
  - For landing, use normal configuration.*
  - LANDING GEAR (fuel permitting, except for flight over water)..... DOWN
- **For any other steps of descent:**
  - 1 PSI DELTA P..... MAINTAIN
- **During approach:**
  - CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**
    - EVACUATION..... INITIATE
    - Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**
    - CABIN CREW and PASSENGERS (PA)..... NOTIFY

### **CABIN PROCEDURES**

If a suspect device is found in the cabin:

<b>WARNING</b>	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
<b>WARNING</b>	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
<b>CAUTION</b>	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

**EOD PERSONNEL ON BOARD..... CHECK**

*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

**BOMB..... DO NOT OPEN**

**BOMB..... DO NOT CUT WIRES**

**BOMB..... SECURE AGAINST SLIPPING**

**BOMB..... AVOID SHOCKS**

*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

**PASSENGERS..... LEAD AWAY FROM BOMB**

*Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*

*Seat backs and tray tables must be in their full upright position.*

*Service items may need to be collected in order to secure tray tables.*

**PORTABLE ELECTRONIC DEVICES..... SWITCH OFF**

*The cabin crews must command passengers to switch off all portable electronic devices.*

## BOMB ON BOARD (Cont'd)

### BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

### EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

### GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

#### ● If the bomb can be moved:

#### RH AFT CABIN DOOR SLIDE.....DISARM

#### LEAST RISK BOMB LOCATION (LRBL).....PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

### BOMB INDICATION LINE.....POSITION

Note: A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m ) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

### BOMB.....MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

**CAUTION** Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

### LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

*Build up at 25 cm (10 in ) of wetted material around the sides and on top of the bomb.*

## BOMB ON BOARD (Cont'd)

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

### PASSENGERS.....MOVE/ADVISE

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

### CABIN CREW..... NOTIFY COCKPIT CREW

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

### EVACUATION/DISEMBARKATION.....EXECUTE

*Evacuate through normal and emergency exits on the opposite side of the "bomb" location. Do not use the door just opposite the "bomb".*

*Use all available airport facilities to disembark without delay.*

## DITCHING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.*

### **PREPARATION**

ATC/TRANSPONDER (if available)..... NOTIFY/SELECT A7700

*Notify ATC of the nature of the emergency encountered, and state intentions. Select transponder code A7700, or transmit the distress message on: (VHF) 121.5 MHz or (HF) 2 182 kHz or 8 364 kHz.*

CABIN and COCKPIT.....PREPARE

*Loose equipment secured, survival equipment prepared, belts and shoulder harness locked.*

AGENTS (ENG and APU)..... DISCH

EVACUATION..... INITIATE

## FORCED LANDING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure*, which has been amended to include the forced landing procedure, when the engines are not running.

### PREPARATION

ATC/TRANSPONDER (if available)..... NOTIFY/SELECT A7700

*Notify ATC of the nature of the emergency encountered, and state intentions.*

*Select transponder code A7700, or transmit the distress message on: (VHF) 121.5 MHz or (HF) 2 182 kHz or 8 364 kHz.*

CABIN and COCKPIT.....PREPARE

- Loose equipment secured
- Survival equipment prepared
- Belts and shoulder harness locked.

GPWS SYS.....OFF

GPWS TERR..... OFF

SIGNS..... ON

GALLEY..... OFF

LDG ELEV..... SET

BARO..... SET

*Omit normal approach and landing checklist.*

CREW MASKS/OXY SUPPLY (below FL 100)..... OFF

### APPROACH

RAM AIR..... ON

L/G lever..... DOWN

SLATS AND FLAPS..... MAX AVAIL

GND SPLR..... ARM

MAX BRK PR..... 1 000 PSI

### AT 2 000 FT AGL

		30 MAR 12
FORCED LANDING (Cont'd)		
<div>■ If Evacuation not required: CABIN CREW and PASSENGERS (PA)..... NOTIFY</div>		

## EMER DESCENT

### IMMEDIATE ACTION

CREW OXY MASKS..... ON  
EMER DESCENT.....ANNOUNCE(PA)

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS..... ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

#### CAUTION

*Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.*

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note: *The recommendation is to descend with the autopilot engaged.  
Use of the autopilot is also permitted in EXPEDITE mode .*

ENG MODE SEL.....IGN

ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note: *Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● In the final approach stages

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.  
Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

REVERSE THRUST..... USE MAX AVAILABLE

● After nosewheel touchdown

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58
20	83	81	78	74	71	66	61	56

45	82	76	70					
50	79	73						
55								

## STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

**NOSE DOWN PITCH CONTROL..... APPLY**

*This will reduce angle of attack*

Note: In case of lack of pitch down authority, reducing thrust may be necessary.

**BANK..... WINGS LEVEL**

● **When out of stall (no longer stall indications) :**

**THRUST..... INCREASE SMOOTHLY AS NEEDED**

Note: In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

**SPEEDBRAKES..... CHECK RETRACTED**

**FLIGHT PATH..... RECOVER SMOOTHLY**

● **If in clean configuration and below 20 000 ft:**

**FLAP 1..... SELECT**

Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

## STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

**THRUST..... TOGA**

At the same time:

**PITCH ATTITUDE..... 15 °**

**BANK..... WINGS LEVEL**

Note: When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

**TAILSTRIKE**

In the event of a tailstrike, apply the following procedure:

**LAND ASAP**

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.*  
*Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

## VOLCANIC ASH ENCOUNTER

● **If the aircraft enters a volcanic ash cloud:**

180 ° TURN..... INITIATE  
ATC..... NOTIFY  
A/THR..... OFF  
THRUST (conditions permitting).....REDUCE  
CREW OXYGEN MASKS.....ON/100 %/EMER  
CABIN CREW.....NOTIFY  
PASSENGER OXYGEN.....AS RQRD  
ENG ANTI ICE..... ON  
WING ANTI ICE..... ON  
PACK FLOW..... HI

Note: If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

APU..... START  
ENGINE PARAMETERS..... MONITOR  
AIRSPEED INDICATIONS.....MONITOR

If airspeed is unreliable or lost, Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.

Note: If all engines flame out and speed indications are lost, Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

Note: If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

CAB PRESS MODE SEL..... MAN  
MAN V/S CTL..... FULL UP

Due to the increased noise level, pay particular attention to visual warnings.

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ At takeoff

#### ■ If before V1

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ If after V1

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA..... SET OR CONFIRM  
 AP (if engaged)..... KEEP  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

**DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.**

**CLOSELY MONITOR FLIGHT PATH AND SPEED.**

**RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.**

WINDSHIELD/WINDOW ARCING

Affected WINDOW/WINDSHIELD ANTI ICE C/B..... PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

**WINDSHIELD/WINDOW CRACKED**

DIAGNOSIS OF INNER PLY.....PERFORM  
*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation  
*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

MAX FL..... 230/MEA  
*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain ΔP 5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note:    *The following procedure allows maintaining ΔP 5 PSI in manual cabin pressure mode.*

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

ΔP = 5 PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

CAB PRESS MODE SEL..... AUTO

Note:    *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL..... FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

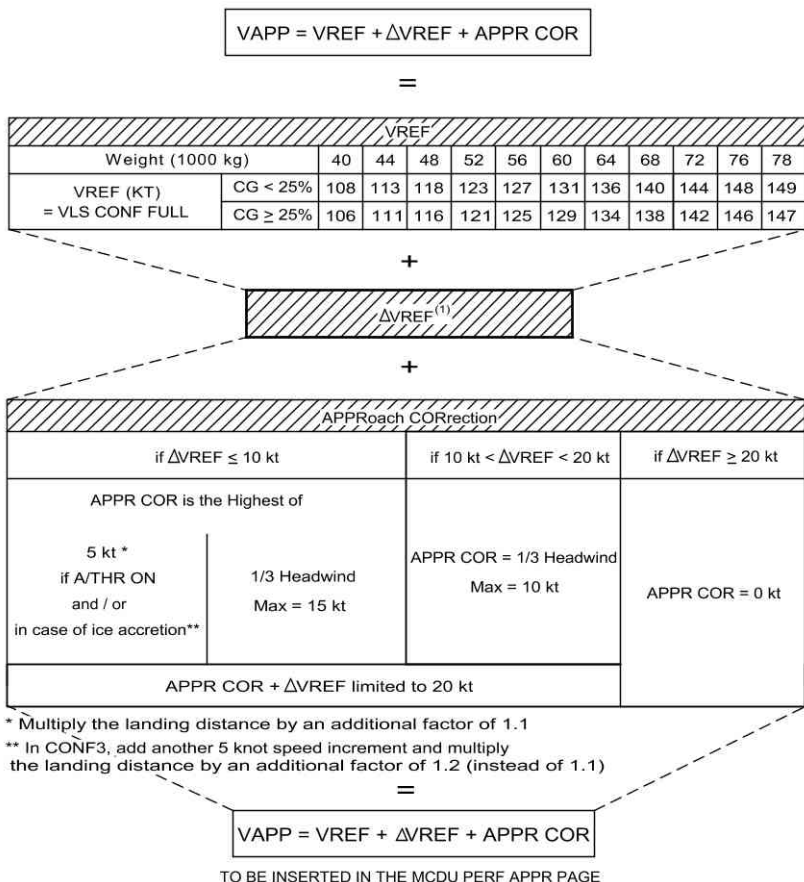

**ECAM ADVISORY CONDITIONS**

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <b>ENG OIL LO PR</b> warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> <p>In both cases, monitor other engine parameters, especially oil temperature and oil quantity.</p>
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	<p>An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.</p> <p><u>Note:</u> If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</p> <p>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</p> <ol style="list-style-type: none"> <li>1. <u>Low Speed</u>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <u>High Speed</u>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

## VAPP CALCULATION

**VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION**

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

**EXAMPLE OF VAPP CALCULATION:**

Failure : ALTN LAW  
 Flight Conditions : Autothrust ON, ice accretion  
 Landing Configuration : CONF 3  
 Headwind : 12 kt  
 Landing Weight/CG : 48 t/25 %  
 VREF determined from the landing weight : 116 kt  
 VREF correction due to the failure (ΔVREF) : 10 kt

As ΔVREF is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- 5+5 = 10 kt (ice accretion and landing in CONF 3)
- 1/3 Headwind = 12 kt/3 = 4 kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

VAPP = VREF + ΔVREF + APPR CORR = 116 + 10 + 10 = 136 kt

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 24pt; font-weight: bold;">80.15</div> <div style="text-align: center;">30 MAR 12</div>
-----------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------

## USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors** “WITHOUT REV” when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors** “WITH REV” when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note:     *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### **LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE**

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### **LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES**

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column (“WITH REV.” or “WITHOUT REV.”)
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
RESULT	3	10			1.40×1.90×1.1=3.00

VREF = 131 kt. Therefore VAPP = 131 + 10 + 5 = 146 kt.

 <div>DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK</div>		<b>ABNORMAL AND EMERGENCY PROCEDURES</b>			<b>80.15A</b>
					30 MAR 12
FAILURES	Flaps Lever Position for Landing	Δ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S ≥ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b>
		30 MAR 12

<b>TRIPPED C/B RE-ENGAGEMENT</b>
----------------------------------

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.20</b>  30 MAR 12
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

### COMPUTER RESET

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor.

The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>
----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollback	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	CP-LVO <b>2/2</b>
		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |
|------------------------------------------------|--------------------------------|
| - α Floor                                      | - Engine Failure               |
| - Autopilot OFF                                | - No 'LAND' green by 350 ft RA |
| - Downgrade below required approach capability | - Autoland warning light       |
| - Amber Caution                                | - No "Flare" by 30 ft          |

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

		30 MAR 12

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
<b>BEFORE TAKEOFF Checklist</b>	

## CONTAMINATED RUNWAY OPERATIONS

### ● TAKEOFF

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

### ● MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note: The maximum crosswind values are given without gust.

Intentionally left blank

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF 3

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		730	760	800	840	890	970	1060	1160	1250
	WET		970	1040	1110	1180	1260	1340	1420	1500	1580
	COVERED WITH	STANDING WATER	1270	1360	1440	1560	1690	1810	1940	2070	2180
		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600

CORRECTION ON ACTUAL LANDING DISTANCE						
RUNWAY CONDITION	dry runway	wet runway	runway covered with			
			standing water	slush	compacted snow	ice
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %
per 10 kt headwind	No correction for headwind due to wind correction on approach speed					
per 10 kt tailwind	+17 %	+21 %	+24 %	+22 %	+16 %	+24 %
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+3 %
2 reversers operative	-5 %	-12 %	-15 %	-14 %	-12 %	-27 %
Per 5 kt speed increment (and no failure) add 8 % (all runways)						

Note:    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
Pressure altitude = 2 000 ft  
Approach speed = VLS + 5 kt  
Dry runway

Read from ALD table,  
ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
Pressure altitude correction: 3 × 2 = +6 %  
Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 × 1.06 × 1.08 = 1 020 m.

## LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78

CORRECTION ON ACTUAL LANDING DISTANCE						
RUNWAY CONDITION	dry runway	wet runway	runway covered with			
			standing water	slush	compacted snow	ice
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %
per 10 kt headwind	No correction for headwind due to wind correction on approach speed					
per 10 kt tailwind	+18 %	+21 %	+22 %	+20 %	+17 %	+25 %
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+2 %
2 reversers operative	-5 %	-11 %	-14 %	-13 %	-11 %	-24 %
Per 5 kt speed increment (and no failure) add 8 % (all runways)						

**Note:** - THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

### EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg

Pressure altitude = 2 000 ft

Approach speed = VLS + 5 kt

## Dry runway

Read from ALD table.

ALD (0 ft , No wind, VLS, no reversers) = 830 m

Read from the Corrections table.

Pressure altitude correction:  $3 \times 2 = +6 \%$

Speed increment correction : +8 %

$$\text{ALD (2 000 ft, No wind, VLS, no reversers)} = 830 \times 1.06 \times 1.08 = 960 \text{ m.}$$

## COST INDEX FOR LONG RANGE CRUISE SPEED

### ALL ENGINES

For a quick determination of the  $CI_{LRC}$ , use:

- $CI_{LRC} = 40$  kg/min in the FMGC.
- or
- $CI_{LRC} = 55$  (100 lb/h) in the FMGC.

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEL condition). The flight crew must still compute and monitor the actual fuel consumption.

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times \text{FPF}$$

This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$

This additional fuel must be added to the fuel predictions provided by the FMS.

Note: Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:

- Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or
- If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

$\text{FPF (HYD G SYS LO PR)} = 10 \%$

$\text{FPF (INOP SYS: L AIL)} = 8 \%$

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (10 \% + 8 \%)$

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times 8 \%$

	B+Y SYS LO PR	SPLR 2+3+4 R ELEV	Spoilers 2, 3 and 4 See Right elevator is failed RAT extended	3 % to 10 % See
L/G	SHOCK ABSORBER FAULT	L/G RETRACT	All landing gears are extended (Also refer to PRO-SPO-25-10)	180 %
	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT	L/G DOOR	All landing gears doors are extended	15 %
	DOORS NOT CLOSED			

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b> 30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

## FUEL PENALTY FACTORS/INOP SYS TABLE

SYS	INOP SYS	CONDITIONS	FUEL PENALTY FACTOR
F/CTL	L(R) AIL or L+R AIL	If one or both aileron(s) is/are indicated partially extended	8 %

	RUDDER TRAVEL LIMIT SYSTEM	1 required for autoland with crosswind higher than 12 kt		
	WINDSHIELD HEAT (L or R windshield)	1 for PF		
	WINDSHIELD WIPERS OR RAIN REPELLENT (if activated)	1 for PF		
	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
ATTITUDE INDICATION (STBY )	1	1	1	
DH INDICATION	1 for PNF			

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:**
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an ENG 1(2) OIL FILTER CLOG ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

Criteria: V2500-A5 Applicable to: B-HSG					
	OEBPROC-11		"ENG 1(2) OIL FILTER CLOG" ECAM Caution During Flight	00013213.0001001	30 MAR 12
Criteria: V2500-A5 Applicable to: B-HSG					

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side).....OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side).....OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED.....OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER.....IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note: *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

## OEB30 Issue 1.0

# NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 188.

One Operator reported a case where the flight crew initiated a Go Around slightly below the Minimum Descent Altitude (MDA), and the aircraft did not pitch up as expected. The flight crew performed a non precision approach (a VORDME approach) using the FINAL APP managed guidance mode with the AP1 (Autopilot) engaged during the final approach.

This OEB is issued to provide flight crews with an operational procedure to avoid such aircraft behavior.

The operational procedure provided in this OEB applies to all Non Precision Approaches, for both conventional approaches and RNAV approaches, flown in FINAL APP managed guidance mode.

**Applicable to:**

All A318/A319/A320/A321 aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-30		No SRS Engagement During Go Around Below MDA	00013527.0002001	30 MAR 12
Criteria: SA Applicable to: B-HSG					

## NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

### ECAM ENTRY

None

### PROCEDURE

During a non precision approach, when using the FINAL APP managed guidance mode:

- **At DA(DH) or MDA(MDH), or earlier in approach if visual conditions are obtained:**

DISENGAGE the FINAL APP mode by pressing the APPR pushbutton on the FCU.

When the flight crew presses the APPR pb in order to disengage the FINAL APP managed guidance mode, a basic vertical guidance mode, either V/S or FPA, engages.

This ensures that the SRS and GA TRK guidance modes correctly engage, if the flight crew initiates a go-around slightly below MDA (MDH).

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

## OEB38 Issue 1.0

# ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

### ECAM ENTRY

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

### PROCEDURE

Apply the corresponding procedures if one of the following ECAM caution is triggered:

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

#### AIR ENG 1(2) BLEED ABNORMAL PR

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED page.....SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

##### ■ If Wing Anti-Ice is ON

##### ● If both PACKS are ON

PACK (affected bleed side).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

#### AIR ENG 1(2) BLEED FAULT

ENG BLEED affected..... OFF

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

# AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT (Cont'd)

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
 PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

■ If Wing Anti-Ice is ON

- If both PACKS are ON  
 PACK (affected bleed side).....OFF

X BLEED..... OPEN  
 BLEED Page..... SELECT and MONITOR

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
 BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

## OEB43 Issue 2.0 F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:**

All A318/A319/A320/A321 Aircrafts.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF

*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10

*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED

*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

F/CTL SPOILER FAULT (Cont'd)

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above  $V_{FE_{NEXT}}$ , the flight crew should deselect A/THR, decelerate to  $V_{FE_{NEXT}}$ , and select CONF 1 when below  $V_{FE_{NEXT}}$ . When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD..... $V_{REF} + 10KT$

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers.....x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

## OEB44 Issue 2.0

### L/G GEAR NOT DOWNLOCKED

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 209.

This OEB is issued to provide operational recommendations in the case of L/G GEAR NOT DOWNLOCKED ECAM warning.

The illustration has been revised to improve the quality and the legibility.

**Applicable to:**

All A320 family aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

IMPORTANT

**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

**TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

**PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

**PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

**Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

**ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

**ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

		30 MAR 12

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

- |                 |   |                                                                                                                                 |
|-----------------|---|---------------------------------------------------------------------------------------------------------------------------------|
| 00, 01, 02, ... | : | Numbering for ABN, GEN, OPS, OEB PROC sections                                                                                  |
| 01A, 03B, ...   | : | Numbering and index (A, B, ...) for procedures written on several paper pages                                                   |
| 1/10, 3/5, ...  | : | Numbering for NP-NP, FPE-SPO                                                                                                    |
| C1, C2          | : | Index of the back cover page interior                                                                                           |
| C3              | : | Index of the back cover page exterior                                                                                           |
| "BLANK"         | : | Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page) |

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

		30 MAR 12

Intentionally left blank

## LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The "CAB PR LDG ELEV FAULT" message is displayed on the ECAM
- A "MAP NOT AVAIL" message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### ■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:

#### ● When the system has recovered:

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### ■ DESCENT (IF TIME PERMITS) :

#### ● When the system has recovered:

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

The method for approach speed computation is given in the QRH ABN 80 (Refer to VAPP Calculation).

FLT ON BAT ONLY

Flight time on batteries only may be increased to at least 30 min as follows:

ENG MODE SEL..... NORM

ANTI ICE PITOT 1 C/B (D02)..... PULL

26 V ADIRU 1 C/B (F07).....PULL

*CM 1 altitude, speed, and vertical speed indication on PFD are lost. Use standby instruments*

● **7 min before landing:**

ANTI ICE PITOT 1 C/B (D02)..... RESET

● **After 1 min:**

<b>CAUTION</b>	This time delay is necessary to ensure reliable speed information even in icing conditions when the ADIRU is reset to ON.
----------------	---------------------------------------------------------------------------------------------------------------------------

26 V ADIRU 1 C/B (F07).....RESET

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● If one or more electrical latches (strikes) are faulty:

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● If two pressure sensors are faulty:

Automatic latch release is not available, in case of cockpit decompression.

● If no LED on the CKPT DOOR CONT panel is on:

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

		30 MAR 12

Intentionally left blank

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

### ■ Repeat the following until landing configuration is reached:

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered.  
*In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

### ● As speed reduces through VFE NEXT:

FLAPS LEVER..... ONE STEP DOWN

### ■ When landing configuration is established:

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

### ■ IF SLATS FAULT:

#### ● FOR CIRCUIT:

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

#### ● FOR DIVERSION

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

### ■ IF FLAPS FAULT:

#### ● FOR CIRCUIT:

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

#### ● FOR DIVERSION:

##### ● If FLAPS jammed at 0

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If **FLAPS jammed > 0**

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

Note:

- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
- In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED						
Slats	Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
S = 0		NO LIMITATION				177 kt
0 < S < 1						(Not allowed)
S = 1		230 kt	215 kt	200 kt	185 kt	
1 < S ≤ 3			200 kt	200 kt	185 kt	177 kt
S > 3			177 kt	177 kt	177 kt	177 kt

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>
		30 MAR 12

Intentionally left blank

**SIDESTICK/RUDDER PEDALS STIFF**

Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:

- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or
- One sidestick and the rudder pedals at the same time.

The piloting technique remains the same: The aircraft remains responsive.  
However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.

AP DISENGAGEMENT..... CONFIRM

CONSIDER TRANSFERRING CONTROL TO PNF

- **FOR DECRAB, ROLLOUT, OR ENGINE FAILURE**  
BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

**STABILIZER JAM**

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
The flight control normal law remains active in this case and there is no ECAM warning.

AP..... OFF  
MAN PITCH TRIM.....CHECK

*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

● **IF MAN TRIM AVAIL:**

TRIM FOR NEUTRAL ELEV

*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

**APPR PROC**

● **IF MAN TRIM NOT AVAIL:**

FOR LDG.....USE FLAP 3

*Do not select configuration full so as not to degrade the handling qualities.*

GPWS LDG FLAP 3..... ON

CAT 2 INOP

**FUEL IMBALANCE**

FOB..... CHECK  
 Compare the FOB + FU, with the FOB at departure.  
 If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. Refer to ABN-28 FUEL LEAK.
----------------	------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON  
 ● On the lighter side and in the center tank:  
   FUEL PUMPS.....OFF  
 ● When fuel is balanced:  
   FUEL PUMPS (WING + CTR)..... ON  
   FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>28.02A</b>
		30 MAR 12

**FUEL LEAK (Cont'd)**

ENGINE RESTART..... CONSIDER

<b>CAUTION</b>	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.
----------------	----------------------------------------------------------------------------------------------------------------------

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

- **If fuel smell in the cabin:**  
 APU (if ON)..... OFF  
*This prevents additional fuel loss through the APU feeding line.*
- **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**  
 CTR TK PUMP 1+2..... ON

**FOR LANDING**

<b>CAUTION</b>	Do not use reversers.
----------------	-----------------------

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
 AVOID NEGATIVE G FACTOR

● **DETERMINE GRAVITY FEED CEILING:**

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● **WHEN REACHING GRVTY FEED CEILING:**

FUEL X FEED..... OFF

● **IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:**

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
 BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
 RUDDER TRIM..... USE

● **WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):**

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or diagonal line),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, Upper ECAM or MCDU 1 is(are) affected.

GEN 1.....OFF

#### ■ If DUs do not stop flashing:

GEN 1..... ON

#### ■ If DUs stop flashing:

GEN 1.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2.....OFF

#### ■ If DUs do not stop flashing:

GEN 2..... ON

#### ■ If DUs stop flashing:

GEN 2.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START..... CONSIDER

### ■ AFFECTED DU IS BLANK or the DISPLAY IS DISTORTED:

DU (affected).....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected)..... USE

*Transfer SD to F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected).....USE

### ■ DIAGONAL LINE ON THE AFFECTED DU:

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

EIS DMC SWITCHING..... AS RQRD

DISPLAY UNIT FAILURE (Cont'd)

- **If unsuccessful:**  
DU (affected)..... OFF THEN ON  
  
*Note:     The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
- **INVERSION OF THE EWD AND THE SD:**  
ECAM UPPER DISPLAY .....OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

LOSS OF BRAKING

- IF NO BRAKING AVAILABLE:  
REV ..... MAX  
BRAKE PEDALS..... RELEASE  
A/SKID & N/W STRG..... OFF  
BRAKE PEDALS..... PRESS  
MAX BRK PR..... 1000 PSI
- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 24pt; font-weight: bold;">32.02</div> <div style="text-align: center;">30 MAR 12</div>
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <b>WHEEL SD</b> page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <u>L/G</u> GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### **PREPARATION**

CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF

*Consider fuel reduction to a safe minimum.*

● **If NOSE L/G abnormal:**

CG location (if possible).....AFT  
 - 10 passengers from front to rear moves the CG roughly 4 % aft.  
 - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.

● **If one MAIN L/G abnormal:**

FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*

OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE  
 - Loose equipment secured.  
 - Survival equipment prepared.  
 - Belts and shoulder harness locked.

### **APPROACH**

GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI

● **If one or both MAIN L/G abnormal:**

GROUND SPOILERS.....DO NOT ARM

### **BEFORE LANDING**

RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER

● **If the external light condition is poor at landing:**

DOMELT.....DIM

### **FLARE, TOUCH DOWN AND ROLL OUT**

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.  
 Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

- **If NOSE L/G abnormal:**  
 NOSE..... MAINTAIN UP  
*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*  
 BRAKES (compatible with elevator efficiency)..... APPLY  
 ENG MASTERS..... OFF  
*Shutdown the engines before nose impact.*

- **If one MAIN L/G abnormal:**  
 ENG MASTERS..... OFF  
*At touchdown, shut down both engines.*  
 FAILURE SIDE WING..... MAINTAIN UP  
*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*  
 DIRECTIONAL CONTROL..... MAINTAIN  
*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

- **If both MAIN L/G abnormal:**  
 ENG MASTERS..... OFF  
*Shut down the engines in the flare, before touchdown.*  
 PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

**WHEN A/C STOPPED**

ENG (all) and APU FIRE pushbutton..... PUSH  
*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*  
 ENG (all) and APU AGENT..... DISCH

- **If Evacuation required:**  
 EVACUATION..... INITIATE  
 - All emergency and passenger doors may be used to evacuate the aircraft.  
 - Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

- **If Evacuation not required:**  
 CABIN CREW and PASSENGERS (PA)..... NOTIFY  
*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

## NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 °,
- 0.9 min for latitudes at or above 55 ° and below 70 °,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

● **If the message occurs during ILS/LOC approach (LOC green):**

DISREGARD it.

● **If the message occurs in climb, cruise, or descent:**

CHECK navigation accuracy, using raw data.

■ **If the check is positive:**

NAV mode and ND ARC/ROSE NAV may be used.

■ **If the check is negative:**

HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

■ **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**

Use the associated FD/AP.

■ **If not:**

Deselect GPS and revert to basic information.

● **If the message occurs during a Non Precision Approach (NPA):**

■ **Overlay approach:**

SELECT HDG, or TRK, and use raw data.

■ **GPS or RNAV approach:**

GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.

During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
 ALIGN light on during 30 s.  
 ATT MODE displayed on CDU.
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

Depending on the CDU keyboard installed, an “H” may be written on the “5” key:

- If “H” is written on the “5” key:
 

H KEY..... PRESS  
 Degree marker, 0 decimal point, ENT and CLR lights come on.

A/C HEADING..... ENTER
- If “H” is not written on the “5” key:
 

A/C HEADING..... ENTER  
 Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.  
 Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.  
 Heading will be displayed on the associated ND.  
 “HDG-ATT MODE” will be displayed on CDU.

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and VMAX.*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s).....OFF  
 REMAINING AIR DATA.....CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR.....KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs.....OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF.....USE FLAP 3

APP SPD.....VLS +10

LDG DIST PROC.....APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST.....CLB

FLAPS.....RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

## AIR DUAL BLEED FAULT

### ■ If ENG1 BLEED was lost due to a:

LEAK on side 1

ENG 1 FIRE

Start Air Valve 1 failed open.

DESCENT TO FL100/MEA..... INITIATE

*Descend rapidly to FL 100/MEA, to prevent excessive cabin altitude.*

AVOID ICING CONDITIONS

#### ● IF ICE ACCRETION

APPR SPD..... VLS + 10 KT

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ If ENG 2 BLEED was lost due to a:

LEAK on side 2

ENG 2 FIRE

Start Air Valve 2 failed open.

X BLEED..... CHECK CLOSED

DESCENT TO FL200/MEA..... INITIATE

*Descend rapidly to FL 200, to recover the bleed supply from the APU.*

APU..... START

*Start the APU during the descent.*

#### ● AT, OR BELOW, FL200 :

WING A.ICE..... OFF

*APU BLEED must not be used for wing anti-ice.*

APU BLEED..... ON

MAX FL200

AVOID ICING CONDITIONS

#### ● IF ICE ACCRETION

APPR SPD..... VLS + 10 KT

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ In all other cases :

DESCENT..... INITIATE

*Descend rapidly to FL 200, so that the bleed supply may be supplied by the APU, if the bleed system recovery is not successful.*

#### ● If both packs are available :

If both packs are operative, it can be suspected that the second bleed system failed due to excessive demand. Recovery of the second failed engine bleed may be attempted.

#### ■ If ENG 1 BLEED is lost first :

PACK 1..... OFF

ENGINE 2 BLEED..... ON

#### ■ If ENG 2 BLEED is lost first :

PACK 2..... OFF

ENGINE 1 BLEED..... ON

**AIR DUAL BLEED FAULT (Cont'd)**

- If engine bleed recovery was not successful, or if one pack is inoperative :  
X BLEED..... CHECK OPEN  
DESCENT TO FL200/MEA.....CONTINUE  
*Descend rapidly to FL 200, to recover the bleed supply from the APU*  
APU.....START  
*Start the APU during the descent.*
- AT, OR BELOW, FL200 :  
WING A.ICE..... OFF  
*APU BLEED must not be used for wing anti-ice.*  
APU BLEED..... ON  
MAX FL200  
AVOID ICING CONDITIONS
- IF ICE ACCRETION  
APPR SPD.....VLS + 10 KT  
LDG DIST PROC..... APPLY

## ENG DUAL FAILURE - FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :

**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
 THR LEVERS..... IDLE  
 FAC 1.....OFF THEN ON  
 ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.

OPTIMUM RELIGHT SPD.....280 KT

*Note: In the case of an "ENG DUAL FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

*In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:*

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

*At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*

VHF1/HF1  /ATC1.....USE

ATC.....NOTIFY

● **IF NO RELIGHT AFTER 30 SEC:**

ENG MASTERS.....OFF 30 S/ON

*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*

CREW OXY MASKS (Above FL 100).....ON

● **WHEN APU AVAIL FL < 200:**

WING ANTI ICE.....OFF

APU BLEED.....ON

ENG MASTERS (one at a time).....OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
GALLEY.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
*Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).*  
GND SPLR..... ARM  
MAX BRK PR..... 1000 PSI

## **ENG 1(2) SHUT DOWN**

■ **Normal :**

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

<b>CAUTION</b>	External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :
----------------	---------------------------------------------------------------------------------------------------------------------------------------------

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

- **When burning has stopped :**  
MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1 ≥ 5 units, N2 ≥ 5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

- Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

- Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0
5	70.0	69.0	68.0	67.0	65.0	64.0	60.0	55.0
10	70.0	69.0	68.0	67.0	65.0	61.0	57.0	52.0
15	70.0	69.0	68.0	66.0	63.0	59.0	54.0	50.0

45	59.0	57.0	55.0					
50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE

*Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.*

NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN

*Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.*

DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

**BOMB ON BOARD (Cont'd)**

- **When at CAB ALT+2 500 ft:**
  - 1 PSI DELTA P..... MAINTAIN
  - GALLEY..... OFF
  - FLAPS (fuel permitting)..... AT LEAST CONF 1
  - For landing, use normal configuration.*
  - LANDING GEAR (fuel permitting, except for flight over water)..... DOWN
- **For any other steps of descent:**
  - 1 PSI DELTA P..... MAINTAIN
- **During approach:**
  - CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**
    - EVACUATION..... INITIATE
    - Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**
    - CABIN CREW and PASSENGERS (PA)..... NOTIFY

**CABIN PROCEDURES**

If a suspect device is found in the cabin:

<b>WARNING</b>	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
<b>WARNING</b>	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
<b>CAUTION</b>	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

- EOD PERSONNEL ON BOARD..... CHECK
- Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*
- BOMB..... DO NOT OPEN
- BOMB..... DO NOT CUT WIRES
- BOMB..... SECURE AGAINST SLIPPING
- BOMB..... AVOID SHOCKS
- Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*
- PASSENGERS..... LEAD AWAY FROM BOMB
- Move passengers at least 4 seat rows away the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*
- Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*
- Seat backs and tray tables must be in their full upright position.*
- Service items may need to be collected in order to secure tray tables.*
- PORTABLE ELECTRONIC DEVICES..... SWITCH OFF
- The cabin crews must command passengers to switch off all portable electronic devices.*

## BOMB ON BOARD (Cont'd)

### BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

### EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

### GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

#### ● If the bomb can be moved:

#### RH AFT CABIN DOOR SLIDE.....DISARM

#### LEAST RISK BOMB LOCATION (LRBL).....PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

<b>CAUTION</b>	<b>DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.</b>
----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

### BOMB INDICATION LINE.....POSITION

Note: *A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

### BOMB.....MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

<b>CAUTION</b>	<b>Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.</b>
----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

<b>CAUTION</b>	<b>DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.</b>
----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

*Build up at 25 cm (10 in) of wetted material around the sides and on top of the bomb.*

## BOMB ON BOARD (Cont'd)

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

### **PASSENGERS.....MOVE/ADVISE**

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

### **CABIN CREW..... NOTIFY COCKPIT CREW**

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

### **EVACUATION/DISEMBARKATION.....EXECUTE**

*Evacuate through normal and emergency exits on the opposite side of the "bomb" location. Do not use the door just opposite the "bomb".*

*Use all available airport facilities to disembark without delay.*

## DITCHING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.*

### **PREPARATION**

ATC/TRANSPONDER (if available)..... NOTIFY/SELECT A7700

*Notify ATC of the nature of the emergency encountered, and state intentions. Select transponder code A7700, or transmit the distress message on: (VHF) 121.5 MHz or (HF) 2 182 kHz or 8 364 kHz.*

CABIN and COCKPIT.....PREPARE

*Loose equipment secured, survival equipment prepared, belts and shoulder harness locked.*

		30 MAR 12
FORCED LANDING (Cont'd)		
<div>■ If Evacuation not required: CABIN CREW and PASSENGERS (PA)..... NOTIFY</div>		

## EMER DESCENT

### IMMEDIATE ACTION

CREW OXY MASKS..... ON  
EMER DESCENT.....ANNOUNCE(PA)

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS..... ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

#### CAUTION

*Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.*

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note: *The recommendation is to descend with the autopilot engaged.  
Use of the autopilot is also permitted in EXPEDITE mode .*

ENG MODE SEL.....IGN

ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note: *Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● In the final approach stages

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.  
Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

REVERSE THRUST..... USE MAX AVAILABLE

● After nosewheel touchdown

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58
20	83	81	78	74	71	66	61	56

45	82	76	70					
50	79	73						
55								

## STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

**NOSE DOWN PITCH CONTROL..... APPLY**

*This will reduce angle of attack*

Note: In case of lack of pitch down authority, reducing thrust may be necessary.

**BANK..... WINGS LEVEL**

● **When out of stall (no longer stall indications) :**

**THRUST..... INCREASE SMOOTHLY AS NEEDED**

Note: In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

**SPEEDBRAKES..... CHECK RETRACTED**

**FLIGHT PATH..... RECOVER SMOOTHLY**

● **If in clean configuration and below 20 000 ft:**

**FLAP 1..... SELECT**

Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

## STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

**THRUST..... TOGA**

At the same time:

**PITCH ATTITUDE..... 15 °**

**BANK..... WINGS LEVEL**

Note: When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

**TAILSTRIKE**

In the event of a tailstrike, apply the following procedure:

**LAND ASAP**

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.*  
*Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

## VOLCANIC ASH ENCOUNTER

● **If the aircraft enters a volcanic ash cloud:**

180 ° TURN..... INITIATE  
ATC..... NOTIFY  
A/THR..... OFF  
THRUST (conditions permitting).....REDUCE  
CREW OXYGEN MASKS.....ON/100 %/EMER  
CABIN CREW.....NOTIFY  
PASSENGER OXYGEN.....AS RQRD  
ENG ANTI ICE..... ON  
WING ANTI ICE..... ON  
PACK FLOW..... HI

Note: If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

APU..... START  
ENGINE PARAMETERS..... MONITOR  
AIRSPEED INDICATIONS.....MONITOR

*If airspeed is unreliable or lost, Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.*

Note: If all engines flame out and speed indications are lost, Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

Note: If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

CAB PRESS MODE SEL..... MAN  
MAN V/S CTL..... FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ At takeoff

#### ■ If before V1

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ If after V1

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA..... SET OR CONFIRM  
 AP (if engaged)..... KEEP  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

**DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.**

**CLOSELY MONITOR FLIGHT PATH AND SPEED.**

**RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.**

WINDSHIELD/WINDOW ARCING

Affected WINDOW/WINDSHIELD ANTI ICE C/B..... PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

**WINDSHIELD/WINDOW CRACKED**

DIAGNOSIS OF INNER PLY.....PERFORM  
*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation  
*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

MAX FL..... 230/MEA  
*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain ΔP 5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note:     *The following procedure allows maintaining ΔP 5 PSI in manual cabin pressure mode.*

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

ΔP = 5 PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

CAB PRESS MODE SEL..... AUTO

Note:     *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL.....FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

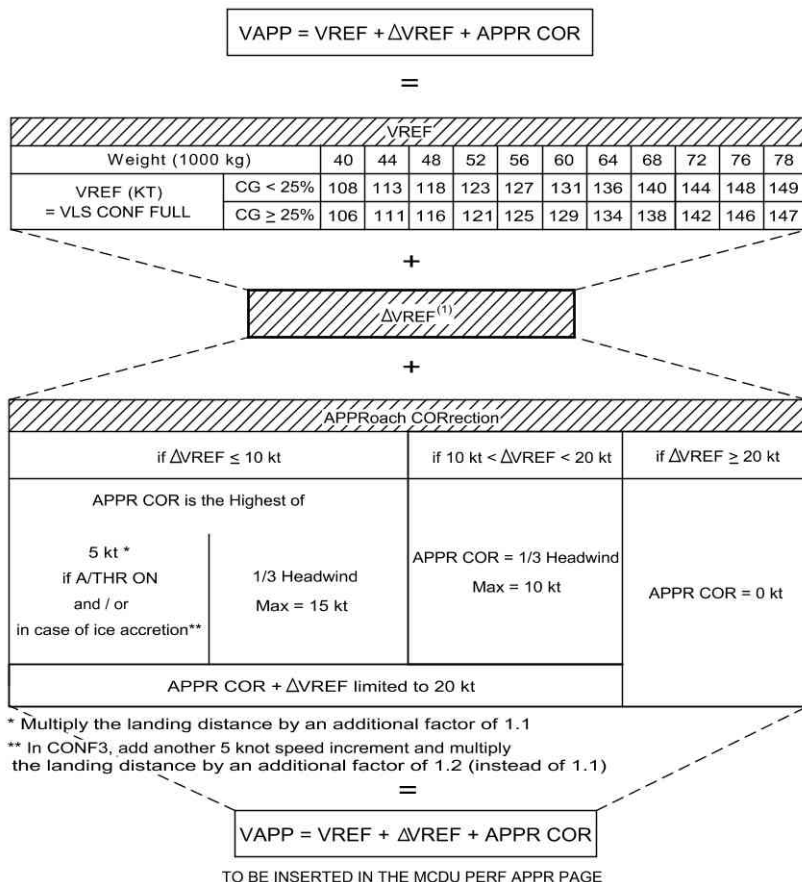

**ECAM ADVISORY CONDITIONS**

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <b>ENG OIL LO PR</b> warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> <p>In both cases, monitor other engine parameters, especially oil temperature and oil quantity.</p>
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	<p>An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.</p> <p><u>Note:</u> If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</p> <p>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</p> <ol style="list-style-type: none"> <li>1. <u>Low Speed</u>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <u>High Speed</u>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

## VAPP CALCULATION

### VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

\* Multiply the landing distance by an additional factor of 1.1

\*\* In CONF3, add another 5 knot speed increment and multiply the landing distance by an additional factor of 1.2 (instead of 1.1)

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

#### EXAMPLE OF VAPP CALCULATION:

Failure : ALTN LAW  
 Flight Conditions : Autothrust ON, ice accretion  
 Landing Configuration : CONF 3  
 Headwind : 12 kt  
 Landing Weight/CG : 48 t/25 %  
 VREF determined from the landing weight : 116 kt  
 VREF correction due to the failure ( $\Delta VREF$ ) : 10 kt

As  $\Delta VREF$  is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- 5+5 = 10 kt (ice accretion and landing in CONF 3)
- 1/3 Headwind = 12 kt/3 = 4 kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

$VAPP = VREF + \Delta VREF + APPR CORR = 116 + 10 + 10 = 136$  kt

<b>USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES</b>
---------------------------------------------------------

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors** “WITHOUT REV” when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors** “WITH REV” when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note:     *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column (“WITH REV.” or “WITHOUT REV.”)
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
RESULT	3	10			1.40×1.90×1.1=3.00

VREF = 131 kt. Therefore VAPP = 131 + 10 + 5 = 146 kt.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK		<b>ABNORMAL AND EMERGENCY PROCEDURES</b>			<b>80.15A</b>
					30 MAR 12
FAILURES	Flaps Lever Position for Landing	Δ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S ≥ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

- <sup>(a)</sup> Multiply the LDG DIST factors by the Actual Landing Distance CONTA without Autobrake - configuration FULL - without any reversers correction. Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL
- <sup>(b)</sup> Flaps FULL and Flaps 3 are both acceptable positions. Flaps FULL is recommended, but the flight crew may use Flaps 3, if necessary, for operational reasons.
- <sup>(c)</sup> In case of dispatch with one or more reverser(s) inoperative, use the LDG DIST factors "WITHOUT REV.", whatever the actual thrust reversers selection at landing.
- <sup>(d)</sup> The applicable landing configuration (CONF 1 or CONF 3) is displayed on the ECAM STATUS page.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b> 30 MAR 12
----------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	---------------------------

## TRIPPED C/B RE-ENGAGEMENT

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

### COMPUTER RESET

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor.

The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
BEFORE TAKEOFF Checklist	

## CONTAMINATED RUNWAY OPERATIONS

### ● TAKEOFF

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

### ● MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note: The maximum crosswind values are given without gust.

		30 MAR 12

Intentionally left blank

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600

CORRECTION ON ACTUAL LANDING DISTANCE						
RUNWAY CONDITION	dry runway	wet runway	runway covered with			
			standing water	slush	compacted snow	ice
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %
per 10 kt headwind	No correction for headwind due to wind correction on approach speed					
per 10 kt tailwind	+17 %	+21 %	+24 %	+22 %	+16 %	+24 %
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+3 %
2 reversers operative	-5 %	-12 %	-15 %	-14 %	-12 %	-27 %
Per 5 kt speed increment (and no failure) add 8 % (all runways)						

Note:    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
Pressure altitude = 2 000 ft  
Approach speed = VLS + 5 kt  
Dry runway

Read from ALD table,  
ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
Pressure altitude correction: 3 × 2 = +6 %  
Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 × 1.06 × 1.08 = 1 020 m.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEL condition). The flight crew must still compute and monitor the actual fuel consumption.

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times \text{FPF}$$

This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$

This additional fuel must be added to the fuel predictions provided by the FMS.

Note: Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:

- Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or
- If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

$\text{FPF (HYD G SYS LO PR)} = 10 \%$

$\text{FPF (INOP SYS: L AIL)} = 8 \%$

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (10 \% + 8 \%)$

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times 8 \%$

	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT			
	DOORS NOT CLOSED	L/G DOOR	All landing gears doors are extended	15 %

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b>
		30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

<b>FUEL PENALTY FACTORS/INOP SYS TABLE</b>

	"AP OFF" ECAM WARNING	1	1	2
	"AUTOLAND" LIGHT	1	1	1
	RUDDER TRAVEL LIMIT SYSTEM	1 required for autoland with crosswind higher than 12 kt		
	WINDSHIELD HEAT (L or R windshield)	1 for PF		
	WINDSHIELD WIPERS OR RAIN REPELLENT (if activated)	1 for PF		
	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
	ATTITUDE INDICATION (STBY )	1	1	1
DH INDICATION	1 for PNF			

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:**
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an **ENG 1(2) OIL FILTER CLOG** ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-11		"ENG 1(2) OIL FILTER CLOG" ECAM Caution During Flight	00013213.0001001	30 MAR 12
Criteria: V2500-A5 Applicable to: B-HSI					

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side)..... OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side)..... OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED..... OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER..... IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note: *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

## OEB30 Issue 1.0

# NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 188.

One Operator reported a case where the flight crew initiated a Go Around slightly below the Minimum Descent Altitude (MDA), and the aircraft did not pitch up as expected. The flight crew performed a non precision approach (a VORDME approach) using the FINAL APP managed guidance mode with the AP1 (Autopilot) engaged during the final approach.

This OEB is issued to provide flight crews with an operational procedure to avoid such aircraft behavior.

The operational procedure provided in this OEB applies to all Non Precision Approaches, for both conventional approaches and RNAV approaches, flown in FINAL APP managed guidance mode.

**Applicable to:**

All A318/A319/A320/A321 aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-30		No SRS Engagement During Go Around Below MDA	00013527.0002001	30 MAR 12
Criteria: SA Applicable to: B-HSI					

## NO SRS ENGAGEMENT DURING GO AROUND BELOW MDA

### ECAM ENTRY

None

### PROCEDURE

During a non precision approach, when using the FINAL APP managed guidance mode:

- **At DA(DH) or MDA(MDH), or earlier in approach if visual conditions are obtained:**

DISENGAGE the FINAL APP mode by pressing the APPR pushbutton on the FCU.

When the flight crew presses the APPR pb in order to disengage the FINAL APP managed guidance mode, a basic vertical guidance mode, either V/S or FPA, engages.

This ensures that the SRS and GA TRK guidance modes correctly engage, if the flight crew initiates a go-around slightly below MDA (MDH).

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

Criteria: SA Applicable to: B-HSI					

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

RED OEB – RED OEB – RED OEB – RED OEB – RED OEB – RED OEB – RED OEB

## OEB38 Issue 1.0

# ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: SA Applicable to: B-HSI				

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

\*\*\*\*\* END OF RED OEB38 ISSUE 1.0 \*\*\*\*\*

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

### ECAM ENTRY

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

### PROCEDURE

Apply the corresponding procedures if one of the following ECAM caution is triggered:

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

#### AIR ENG 1(2) BLEED ABNORMAL PR

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED page.....SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

##### ■ If Wing Anti-Ice is ON

##### ● If both PACKS are ON

PACK (affected bleed side).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

#### AIR ENG 1(2) BLEED FAULT

ENG BLEED affected..... OFF

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

<b>AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT (Cont'd)</b>
--------------------------------------------------------------------------------

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
 PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

■ If Wing Anti-Ice is ON

- If both PACKS are ON  
 PACK (affected bleed side).....OFF

X BLEED..... OPEN  
 BLEED Page..... SELECT and MONITOR

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
 BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

## OEB43 Issue 2.0 F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:**

All A318/A319/A320/A321 Aircrafts.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF

*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10

*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED

*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

F/CTL SPOILER FAULT (Cont'd)

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above VFE<sub>NEXT</sub>, the flight crew should deselect A/THR, decelerate to VFE<sub>NEXT</sub>, and select CONF 1 when below VFE<sub>NEXT</sub>. When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD.....VREF + 10KT

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers..... x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

## OEB44 Issue 2.0

### L/G GEAR NOT DOWNLOCKED

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 209.

This OEB is issued to provide operational recommendations in the case of L/G GEAR NOT DOWNLOCKED ECAM warning.

The illustration has been revised to improve the quality and the legibility.

**Applicable to:**

All A320 family aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## L/G GEAR NOT DOWNLOCKED

### ECAM ENTRY

L/G GEAR NOT DOWNLOCKED

### PROCEDURE

Apply the following procedure if the ECAM triggers the L/G GEAR NOT DOWNLOCKED warning:

#### L/G GEAR NOT DOWNLOCKED

*This warning appears, if the landing gear sequence is not completed after 30 seconds.*

L/G lever.....RECYCLE

•IF GEAR NOT DOWNLOCKED AFTER 2 MINUTES:

L/G GRAVITY EXTENSION PROC.....APPLY

STATUS

The status displayed on the ECAM is correct.

IMPORTANT

**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

**TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

**PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

**PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

**Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

**ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

**ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

# USE OF SUMMARIES

## GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES. These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

## APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

## APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

- |                 |   |                                                                                                                                 |
|-----------------|---|---------------------------------------------------------------------------------------------------------------------------------|
| 00, 01, 02, ... | : | Numbering for ABN, GEN, OPS, OEB PROC sections                                                                                  |
| 01A, 03B, ...   | : | Numbering and index (A, B, ...) for procedures written on several paper pages                                                   |
| 1/10, 3/5, ...  | : | Numbering for NP-NP, FPE-SPO                                                                                                    |
| C1, C2          | : | Index of the back cover page interior                                                                                           |
| C3              | : | Index of the back cover page exterior                                                                                           |
| "BLANK"         | : | Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page) |

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

## **LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)**

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The "CAB PR LDG ELEV FAULT" message is displayed on the ECAM
- A "MAP NOT AVAIL" message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### **■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:**

#### **● When the system has recovered:**

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### **■ DESCENT (IF TIME PERMITS) :**

#### **● When the system has recovered:**

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● If one or more electrical latches (strikes) are faulty:

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● If two pressure sensors are faulty:

Automatic latch release is not available, in case of cockpit decompression.

● If no LED on the CKPT DOOR CONT panel is on:

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

		30 MAR 12

Intentionally left blank

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

■ **Repeat the following until landing configuration is reached:**

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered.  
*In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

● **As speed reduces through VFE NEXT:**

FLAPS LEVER..... ONE STEP DOWN

■ **When landing configuration is established:**

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

■ **IF SLATS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION**

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

■ **IF FLAPS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION:**

● **If FLAPS jammed at 0**

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

- Note:
- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
  - In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED

Slats	Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
S = 0	NO LIMITATION	230 kt	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1						
S = 1						
1 < S ≤ 3	200 kt		200 kt	185 kt	177 kt	
S > 3	177 kt		177 kt	177 kt	177 kt	

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>
		30 MAR 12

Intentionally left blank

**SIDESTICK/RUDDER PEDALS STIFF**

Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:

- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or
- One sidestick and the rudder pedals at the same time.

The piloting technique remains the same: The aircraft remains responsive.  
However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.

AP DISENGAGEMENT..... CONFIRM

CONSIDER TRANSFERRING CONTROL TO PNF

- **FOR DECRAB, ROLLOUT, OR ENGINE FAILURE**  
BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

# STABILIZER JAM

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
 The flight control normal law remains active in this case and there is no ECAM warning.

AP..... OFF  
 MAN PITCH TRIM.....CHECK

*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

- IF MAN TRIM AVAIL:**  
 TRIM FOR NEUTRAL ELEV  
*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

## APPR PROC

- IF MAN TRIM NOT AVAIL:**  
 FOR LDG.....USE FLAP 3  
*Do not select configuration full so as not to degrade the handling qualities.*  
 GPWS LDG FLAP 3..... ON  
 CAT 2 INOP

FUEL IMBALANCE

FOB..... CHECK  
*Compare the FOB + FU, with the FOB at departure.  
If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.*

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. <i>Refer to ABN-28 FUEL LEAK.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON

- **On the lighter side and in the center tank:**  
FUEL PUMPS.....OFF
- **When fuel is balanced:**  
FUEL PUMPS (WING + CTR)..... ON  
FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>28.02A</b>
		30 MAR 12

**FUEL LEAK (Cont'd)**

ENGINE RESTART..... CONSIDER

<b>CAUTION</b>	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.
----------------	----------------------------------------------------------------------------------------------------------------------

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

- **If fuel smell in the cabin:**  
 APU (if ON)..... OFF  
*This prevents additional fuel loss through the APU feeding line.*
- **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**  
 CTR TK PUMP 1+2..... ON

**FOR LANDING**

<b>CAUTION</b>	Do not use reversers.
----------------	-----------------------

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or diagonal line),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, Upper ECAM or MCDU 1 is(are) affected.

GEN 1.....OFF

#### ■ If DUs do not stop flashing:

GEN 1.....ON

#### ■ If DUs stop flashing:

GEN 1.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM.....CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START.....CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2.....OFF

#### ■ If DUs do not stop flashing:

GEN 2.....ON

#### ■ If DUs stop flashing:

GEN 2.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM.....CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START.....CONSIDER

### ■ AFFECTED DU IS BLANK or the DISPLAY IS DISTORTED:

DU (affected).....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected).....USE

*Transfer SD to F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected).....USE

### ■ DIAGONAL LINE ON THE AFFECTED DU:

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

EIS DMC SWITCHING.....AS RQRD

DISPLAY UNIT FAILURE (Cont'd)

- **If unsuccessful:**  
DU (affected)..... OFF THEN ON  
  
*Note:     The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
- **INVERSION OF THE EWD AND THE SD:**  
ECAM UPPER DISPLAY .....OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <u>WHEEL</u> SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <u>L/G</u> GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### PREPARATION

CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF

*Consider fuel reduction to a safe minimum.*

● **If NOSE L/G abnormal:**

CG location (if possible).....AFT  
 - 10 passengers from front to rear moves the CG roughly 4 % aft.  
 - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.

● **If one MAIN L/G abnormal:**

FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*

OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE  
 - Loose equipment secured.  
 - Survival equipment prepared.  
 - Belts and shoulder harness locked.

### APPROACH

GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI

● **If one or both MAIN L/G abnormal:**

GROUND SPOILERS.....DO NOT ARM

### BEFORE LANDING

RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER

● **If the external light condition is poor at landing:**

DOME LT.....DIM

### FLARE, TOUCH DOWN AND ROLL OUT

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.

Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

## LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

● **If NOSE L/G abnormal:**

NOSE..... MAINTAIN UP

*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*

BRAKES (compatible with elevator efficiency)..... APPLY

ENG MASTERS..... OFF

*Shutdown the engines before nose impact.*

● **If one MAIN L/G abnormal:**

ENG MASTERS..... OFF

*At touchdown, shut down both engines.*

FAILURE SIDE WING..... MAINTAIN UP

*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*

DIRECTIONAL CONTROL..... MAINTAIN

*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

● **If both MAIN L/G abnormal:**

ENG MASTERS..... OFF

*Shut down the engines in the flare, before touchdown.*

PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

### WHEN A/C STOPPED

ENG (all) and APU FIRE pushbutton..... PUSH

*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*

ENG (all) and APU AGENT..... DISCH

■ **If Evacuation required:**

EVACUATION..... INITIATE

- All emergency and passenger doors may be used to evacuate the aircraft.

- Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

■ **If Evacuation not required:**

CABIN CREW and PASSENGERS (PA)..... NOTIFY

*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

## ADR 1 + 2 + 3 FAULT

The ECAM does not display this procedure. In the case of a triple ADR failure, the ECAM only displays dual ADR warnings.

ADR P/B (all)..... OFF  
STBY INST..... USE

Note: Disregard ECAM actions for AIR DATA SWTG and ATC since these have no effect in the case of a total loss of ADRs.

### ASSOCIATED PROCEDURES

## F/CTL ALTN LAW

### (PROT LOST)

MAX SPEED..... 320/0.82

See the following table for the IAS/M relationship for 0.82

FL	390	370	350	330	310	290	280 and below
MAX SPD	252	265	278	290	305	315	320

WHEN L/G DN: DIRECT LAW

At landing gear extension, control reverts to direct law in pitch, as well as in roll.

Note: Use manual control of cabin pressurization.

MODE SEL.....MAN

MAN V/S CTL.....AS RQRD

### STATUS

MAX SPEED..... 320/0.82

		30 MAR 12

Intentionally left blank

## NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 °,
- 0.9 min for latitudes at or above 55 ° and below 70 °,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

- **If the message occurs during ILS/LOC approach (LOC green):**  
DISREGARD it.

- **If the message occurs in climb, cruise, or descent:**  
CHECK navigation accuracy, using raw data.

- **If the check is positive:**  
NAV mode and ND ARC/ROSE NAV may be used.

- **If the check is negative:**  
HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

- **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**  
Use the associated FD/AP.

- **If not:**  
Deselect GPS and revert to basic information.

- **If the message occurs during a Non Precision Approach (NPA):**
  - **Overlay approach:**  
SELECT HDG, or TRK, and use raw data.
  - **GPS or RNAV approach:**  
GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.  
During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
*ALIGN light on during 30 s.*  
*ATT MODE displayed on CDU.*
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

■ **MCDU INITIALIZATION:**

- DATA (MCDU KEY)..... PRESS  
*The DATA INDEX page is displayed.*
- IRS MONITOR (2L KEY).....PRESS  
*The IRS MONITOR page is displayed.*
- A/C HEADING..... ENTER  
*The flight crew must enter the heading in the SET HDG field (5R KEY).*

■ **CDU INITIALIZATION:**

- Depending on the CDU keyboard installed, an “H” may be written on the “5” key:
- **If “H” is written on the “5” key:**
- H KEY.....PRESS  
*Degree marker, 0 decimal point, ENT and CLR lights come on.*
- A/C HEADING..... ENTER
- **If “H” is not written on the “5” key:**
- A/C HEADING..... ENTER  
*Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.*  
*Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.*  
*Heading will be displayed on the associated ND.*  
*“HDG–ATT MODE” will be displayed on CDU.*

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and  $V_{MAX}$ .*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

#### ■ If at least one ADR is reliable:

Faulty ADR(s)..... OFF  
 REMAINING AIR DATA..... CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

#### ■ If affected ADR(s) cannot be identified or all ADRs are affected:

ONE ADR..... KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs..... OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF..... USE FLAP 3

APP SPD..... VLS +10

LDG DIST PROC..... APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

#### ■ To return to departure airport:

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

#### ■ To accelerate and clean up after takeoff:

Accelerate and clean up the aircraft in level flight:

THRUST..... CLB

FLAPS..... RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

Intentionally left blank

## AIR DUAL BLEED FAULT

### ■ If ENG1 BLEED was lost due to a:

LEAK on side 1

ENG 1 FIRE

Start Air Valve 1 failed open.

DESCENT TO FL100/MEA..... INITIATE

*Descend rapidly to FL 100/MEA, to prevent excessive cabin altitude.*

AVOID ICING CONDITIONS

#### ● IF ICE ACCRETION

APPR SPD..... VLS + 10 KT

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ If ENG 2 BLEED was lost due to a:

LEAK on side 2

ENG 2 FIRE

Start Air Valve 2 failed open.

X BLEED..... CHECK CLOSED

DESCENT TO FL200/MEA..... INITIATE

*Descend rapidly to FL 200, to recover the bleed supply from the APU.*

APU..... START

*Start the APU during the descent.*

#### ● AT, OR BELOW, FL200 :

WING A.ICE..... OFF

*APU BLEED must not be used for wing anti-ice.*

APU BLEED..... ON

MAX FL200

AVOID ICING CONDITIONS

#### ● IF ICE ACCRETION

APPR SPD..... VLS + 10 KT

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ In all other cases :

DESCENT..... INITIATE

*Descend rapidly to FL 200, so that the bleed supply may be supplied by the APU, if the bleed system recovery is not successful.*

#### ● If both packs are available :

If both packs are operative, it can be suspected that the second bleed system failed due to excessive demand. Recovery of the second failed engine bleed may be attempted.

#### ■ If ENG 1 BLEED is lost first :

PACK 1..... OFF

ENGINE 2 BLEED..... ON

#### ■ If ENG 2 BLEED is lost first :

PACK 2..... OFF

ENGINE 1 BLEED..... ON

**AIR DUAL BLEED FAULT (Cont'd)**

- If engine bleed recovery was not successful, or if one pack is inoperative :
  - X BLEED..... CHECK OPEN
  - DESCENT TO FL200/MEA.....CONTINUE
  - Descend rapidly to FL 200, to recover the bleed supply from the APU*
  - APU.....START
  - Start the APU during the descent.*
  - **AT, OR BELOW, FL200 :**
    - WING A.ICE..... OFF
    - APU BLEED must not be used for wing anti-ice.*
    - APU BLEED..... ON
    - MAX FL200
    - AVOID ICING CONDITIONS
    - **IF ICE ACCRETION**
      - APPR SPD.....VLS + 10 KT
      - LDG DIST PROC..... APPLY
      - Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

## ENG DUAL FAILURE - FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :

**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
 THR LEVERS..... IDLE  
 FAC 1.....OFF THEN ON  
 ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.

OPTIMUM RELIGHT SPD.....280 KT

*Note: In the case of an "ENG DUAL FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

*In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:*

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

*At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*

VHF1/HF1  /ATC1.....USE

ATC.....NOTIFY

● **IF NO RELIGHT AFTER 30 SEC:**

ENG MASTERS.....OFF 30 S/ON

*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*

● **IF UNSUCCESSFUL:**

CREW OXY MASKS (Above FL 100).....ON

● **WHEN BELOW FL 250**

APU (IF AVAIL).....START

● **WHEN BELOW FL 200**

WING ANTI ICE.....OFF

APU BLEED.....ON

ENG MASTERS (one at a time).....OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
GALY & CAB.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
*Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).*  
GND SPLR..... ARM  
MAX BRK PR..... 1000 PSI

DITCHING pushbutton..... ON  
*Prefer ditching parallel to the swell.  
If that causes a strong crosswind, ditch into the wind.  
In all cases, touch down with a pitch attitude of approximately 11 °.  
Minimize aircraft vertical speed.*

AT 500 FT AGL  
BRACE FOR IMPACT..... ORDER

AT TOUCHDOWN  
ENG MASTERS..... OFF  
APU MASTER SW..... OFF

AFTER DITCHING  
ATC (VHF 1).....NOTIFY  
FIRE pushbutton (ENG and APU).....PUSH  
AGENT (ENG and APU)..... DISCH  
*Engine Agent 2 is not available.*  
EVACUATION..... INITIATE  
ELT  ..... CHECK EMITTING  
*If not, switch on the transmitter.*

## ENG DUAL FAILURE - NO FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
THRUST LEVERS..... IDLE  
FAC 1.....OFF THEN ON

*Then apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.*

OPTIMUM SPEED.....220 KT/GREEN DOT

*Initially, fly 220 kt, because the PFD may not display the correct green dot speed. Then fly the green dot speed according to the following table:*

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

*At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind). Average rate of descent is approximately 1 600 ft/min .*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached or the most appropriate place for a forced landing/ditching.*

VHF1/HF1 /ATC1.....USE

ATC..... NOTIFY

CREW OXY MASKS (Above FL 100)..... ON

## ENG RELIGHT (IN FLIGHT)

- |                                       |           |
|---------------------------------------|-----------|
| MAX ALTITUDE.....                     | See below |
| ENG MASTER (affected).....            | OFF       |
| THR LEVER (affected).....             | IDLE      |
| ENG MODE SEL.....                     | IGN       |
| X BLEED .....                         | OPEN      |
| WING A. ICE (for starter assist)..... | OFF       |
| ENG MASTER (affected).....            | ON        |

*Be aware that, contrary to an autostart on ground, the crew must take appropriate action in case of an abnormal start.*

*Engine light up should be achieved within 30 s after fuel flow increases.*

■ **When idle is reached (AVAIL indication pulses in green) :**

- |                      |             |
|----------------------|-------------|
| ENG MODE SEL.....    | NORM        |
| TCAS MODE SEL  ..... | check TA/RA |
- Check that the selector is at TA/RA since, if the ENG SHUT DOWN procedure has been applied, the TCAS mode selector may have been set at the TA position.*
- |                   |         |
|-------------------|---------|
| Affected SYS..... | RESTORE |
|-------------------|---------|

■ **If no relight :**

- |                            |     |
|----------------------------|-----|
| ENG MASTER (affected)..... | OFF |
|----------------------------|-----|
- Wait 30 s before attempting a new start (to drain the engine).*

## **ENG 1(2) STALL**

■ **On the ground :**

THR LEVER (AFFECTED ENGINE)..... IDLE

ENG MASTER (AFFECTED ENGINE)..... OFF

■ **In flight :**

THR LEVER (AFFECTED ENGINE)..... IDLE

ENG PARAMETERS (AFFECTED ENGINE)..... CHECK

■ **IF ABNORMAL :**

ENG MASTER (AFFECTED ENGINE)..... OFF

———— ASSOCIATED PROCEDURES ————

## **ENG 1(2) SHUT DOWN**

■ **Normal :**

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION

External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

● When burning has stopped :

MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1 ≥ 5 units, N2 ≥ 5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

- Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

- Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0
5	70.0	69.0	68.0	67.0	65.0	64.0	60.0	55.0
10	70.0	69.0	68.0	67.0	65.0	61.0	57.0	52.0

45	59.0	57.0	55.0					
50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE

*Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.*

NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN

*Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.*

DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

## BOMB ON BOARD (Cont'd)

- **When at CAB ALT + 2 500 ft:**
  - 1 PSI DELTA P..... MAINTAIN
  - GALY & CAB.....OFF
  - FLAPS (fuel permitting)..... AT LEAST CONF 1
  - For landing, use normal configuration.*
  - LANDING GEAR (fuel permitting, except for flight over water).....DOWN
- **For any other steps of descent:**
  - 1 PSI DELTA P..... MAINTAIN
- **During approach:**
  - CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**
    - EVACUATION.....INITIATE
    - Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**
    - CABIN CREW and PASSENGERS (PA)..... NOTIFY

### **CABIN PROCEDURES**

If a suspect device is found in the cabin:

<b>WARNING</b>	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
<b>WARNING</b>	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
<b>CAUTION</b>	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

**EOD PERSONNEL ON BOARD.....CHECK**

*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

**BOMB.....DO NOT OPEN**

**BOMB.....DO NOT CUT WIRES**

**BOMB.....SECURE AGAINST SLIPPING**

**BOMB.....AVOID SHOCKS**

*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

**PASSENGERS.....LEAD AWAY FROM BOMB**

*Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*

*Seat backs and tray tables must be in their full upright position.*

*Service items may need to be collected in order to secure tray tables.*

**PORTABLE ELECTRONIC DEVICES..... SWITCH OFF**

*The cabin crews must command passengers to switch off all portable electronic devices.*

## BOMB ON BOARD (Cont'd)

### BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

### EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

### GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

#### ● If the bomb can be moved:

#### RH AFT CABIN DOOR SLIDE.....DISARM

#### LEAST RISK BOMB LOCATION (LRBL).....PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

### BOMB INDICATION LINE.....POSITION

Note: A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m ) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

### BOMB.....MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

**CAUTION** Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

### LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

**CAUTION** DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

*Build up at 25 cm (10 in ) of wetted material around the sides and on top of the bomb.*

## BOMB ON BOARD (Cont'd)

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

### PASSENGERS.....MOVE/ADVISE

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

### CABIN CREW.....NOTIFY COCKPIT CREW

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

### EVACUATION/DISEMBARKATION.....EXECUTE

*Evacuate through normal and emergency exits on the opposite side of the "bomb" location. Do not use the door just opposite the "bomb".*

*Use all available airport facilities to disembark without delay.*

## DITCHING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.*

### **PREPARATION**

ATC/TRANSPONDER (if available)..... NOTIFY/SELECT A7700

*Notify ATC of the nature of the emergency encountered, and state intentions. Select transponder code A7700, or transmit the distress message on: (VHF) 121.5 MHz or (HF) 2 182 kHz or 8 364 kHz.*

CABIN and COCKPIT.....PREPARE

*Loose equipment secured, survival equipment prepared, belts and shoulder harness locked.*

EVACUATION..... INITIATE

## FORCED LANDING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure*, which has been amended to include the forced landing procedure, when the engines are not running.

### PREPARATION

ATC /TRANSPONDER (if available)..... NOTIFY/SELECT A7700

*Notify ATC of the nature of the emergency encountered, and state intentions.*

*Select transponder code A7700, or transmit the distress message on: (VHF) 121.5 MHz or (HF) 2 182 kHz or 8 364 kHz .*

CABIN and COCKPIT.....PREPARE

- Loose equipment secured
- Survival equipment prepared
- Belts and shoulder harness locked.

GPWS SYS.....OFF

GPWS TERR.....OFF

SIGNS.....ON

GALY & CAB.....OFF

LDG ELEV.....SET

BARO.....SET

*Omit normal approach and landing checklist.*

CREW MASKS/OXY SUPPLY (below FL 100).....OFF

### APPROACH

RAM AIR.....ON

		30 MAR 12
FORCED LANDING (Cont'd)		
<div>■ If Evacuation not required: CABIN CREW and PASSENGERS (PA)..... NOTIFY</div>		

## EMER DESCENT

### IMMEDIATE ACTION

CREW OXY MASKS..... ON  
EMER DESCENT.....ANNOUNCE(PA)

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS..... ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

#### CAUTION

*Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.*

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note: *The recommendation is to descend with the autopilot engaged.  
Use of the autopilot is also permitted in EXPEDITE mode .*

ENG MODE SEL.....IGN

ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note: *Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK  
PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● In the final approach stages

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.  
Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

REVERSE THRUST..... USE MAX AVAILABLE

● After nosewheel touchdown

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58
20	83	81	78	74	71	66	61	56
25	83	81	78	74	70	64	59	
30	83	81	78	73	67			
35	83	81	76	70	65			
40	83	80	73	67				
45	82	76	70					
50	79	73						
55								

## STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

**NOSE DOWN PITCH CONTROL..... APPLY**

*This will reduce angle of attack*

Note: In case of lack of pitch down authority, reducing thrust may be necessary.

**BANK..... WINGS LEVEL**

● **When out of stall (no longer stall indications) :**

**THRUST..... INCREASE SMOOTHLY AS NEEDED**

Note: In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

**SPEEDBRAKES..... CHECK RETRACTED**

**FLIGHT PATH..... RECOVER SMOOTHLY**

● **If in clean configuration and below 20 000 ft:**

**FLAP 1..... SELECT**

Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

## STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

**THRUST..... TOGA**

At the same time:

**PITCH ATTITUDE..... 15 °**

**BANK..... WINGS LEVEL**

Note: When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

TAILSTRIKE

In the event of a tailstrike, apply the following procedure:

LAND ASAP

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.*  
*Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

## VOLCANIC ASH ENCOUNTER

● **If the aircraft enters a volcanic ash cloud:**

180 ° TURN..... INITIATE  
ATC..... NOTIFY  
A/THR..... OFF  
THRUST (conditions permitting).....REDUCE  
CREW OXYGEN MASKS.....ON/100 %/EMER  
CABIN CREW.....NOTIFY  
PASSENGER OXYGEN.....AS RQRD  
ENG ANTI ICE..... ON  
WING ANTI ICE..... ON  
PACK FLOW..... HI

Note: If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

APU..... START  
ENGINE PARAMETERS..... MONITOR  
AIRSPEED INDICATIONS.....MONITOR

If airspeed is unreliable or lost, Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.

Note: If all engines flame out and speed indications are lost, Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

Note: If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

CAB PRESS MODE SEL..... MAN  
MAN V/S CTL..... FULL UP

Due to the increased noise level, pay particular attention to visual warnings.

## WINDSHEAR AHEAD

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear.

Note: When a predictive windshear alert ("WINDSHEAR AHEAD" or "GO AROUND WINDSHEAR AHEAD") is triggered, if the flight crew makes a positive verification that no hazard exists, then the alert may be disregarded, as long as:

- There are no other signs of possible windshear conditions, and
- The reactive windshear system is operational.

*Known cases of spurious predictive windshear alerts have been reported at some airports, during either takeoff or landing, due to the specific obstacle environment. However, always rely on any reactive windshear ("WINDSHEAR").*

### W/S AHEAD RED

#### ■ Takeoff

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

##### ● **Before takeoff**

Delay takeoff, or select the most favorable runway.

##### ● **During the takeoff run**

Reject takeoff.

Note: Predictive windshear alerts are inhibited above 100 kts until 50 ft.

##### ● **When airborne**

THR LEVERS.....TOGA

*As usual, the slat/flap configuration can be changed, provided the windshear is not entered.*

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if required.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha_{prot}$ .
  2. If the FD is not available, use a pitch initial attitude up to 17.5°. If necessary to minimize the loss of height, increase this pitch attitude.

#### ■ Landing

Associated with an aural synthetic voice "GO AROUND, WINDSHEAR AHEAD".

GO AROUND.....PERFORM

*This includes the use of full backstick, if required.*

- Note:
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha_{prot}$ .
  2. If the FD is not available, use a pitch initial attitude up to 17.5°. If necessary to minimize the loss of height, increase this pitch attitude.

### W/S AHEAD AMBER

Apply precautionary measures, as indicated below:

#### ■ **Before TAKEOFF**

Delay takeoff until conditions improve.

Evaluate takeoff conditions :

- Using observations and experience.
- Checking weather conditions.

Select the most favorable runway (considering location of the likely windshear).

## WINDSHEAR AHEAD (Cont'd)

Use the weather radar or the predictive windshear system before commencing takeoff to ensure that the flight path clears any potential problem areas.

Select TOGA thrust.

Monitor closely airspeed and airspeed trend during the takeoff run for early signs of windshear.

### ■ **During Approach**

Delay landing or divert to another airport until conditions are more favorable.

Evaluate condition for a safe landing by :

- Using observations and experience.
- Checking weather conditions.

Use the weather radar.

Select the most favorable runway, considering also which has the most appropriate approach aid.

Select FLAPS 3.

Use managed speed in the approach phase.

Check both FDs engaged in ILS, FPA or V/S.

Engage the autopilot, for a more accurate approach and earlier recognition of deviation from the beam, when ILS is available.

Note:    - *When it is using the GS mini-function, associated with managed speed, the system will carry extra speed in strong wind conditions.*  
               - *In case of strong or gusty crosswind greater than 20 kt, Refer to FPE-IFL VAPP Determination.*

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ **At takeoff**

#### ■ **If before V1**

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ **If after V1**

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

Note:    1. *If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.*  
               2. *If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.*

---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	----------------------------

## WINDSHEAR (Cont'd)

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA.....SET OR CONFIRM  
 AP (if engaged).....KEEP  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

Note:

1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

**DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.**

**CLOSELY MONITOR FLIGHT PATH AND SPEED.**

**RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.**

WINDSHIELD/WINDOW ARCING

Affected WINDOW/WINDSHIELD ANTI ICE C/B..... PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

**WINDSHIELD/WINDOW CRACKED**

DIAGNOSIS OF INNER PLY.....PERFORM  
*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation  
*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

MAX FL..... 230/MEA  
*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain ΔP 5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note:    *The following procedure allows maintaining ΔP 5 PSI in manual cabin pressure mode.*

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

ΔP = 5 PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

CAB PRESS MODE SEL..... AUTO

Note:    *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

CAB PRESS MODE SEL..... MAN  
 MAN V/S CTL.....FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

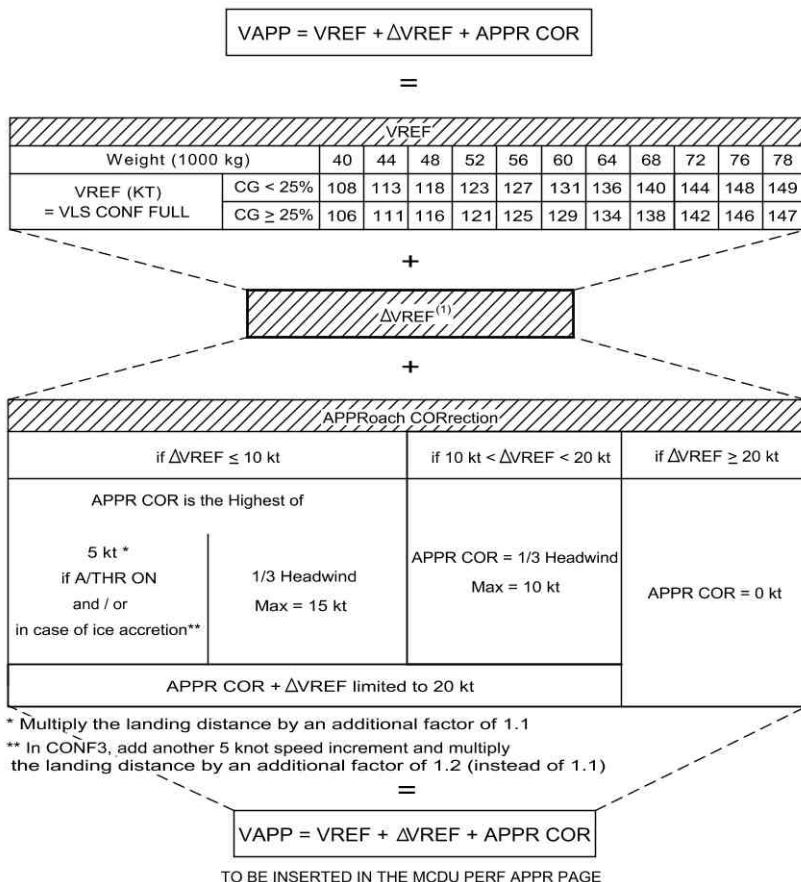

**ECAM ADVISORY CONDITIONS**

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <u>ENG</u> OIL LO PR warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> <p>In both cases, monitor other engine parameters, especially oil temperature and oil quantity.</p>
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	<p>An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.</p> <p><u>Note:</u> If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</p> <p>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</p> <ol style="list-style-type: none"> <li>1. <u>Low Speed</u>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <u>High Speed</u>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

## VAPP CALCULATION

### VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

#### EXAMPLE OF VAPP CALCULATION:

Failure : ALTN LAW  
 Flight Conditions : Autothrust ON, ice accretion  
 Landing Configuration : CONF 3  
 Headwind : 12 kt  
 Landing Weight/CG : 48 t/25 %  
 VREF determined from the landing weight : 116 kt  
 VREF correction due to the failure ( $\Delta VREF$ ) : 10 kt

As  $\Delta VREF$  is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- 5+5 = 10 kt (ice accretion and landing in CONF 3)
- 1/3 Headwind = 12 kt/3 = 4 kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

$VAPP = VREF + \Delta VREF + APPR CORR = 116 + 10 + 10 = 136$  kt

<b>USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES</b>
---------------------------------------------------------

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors “WITHOUT REV”** when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors “WITH REV”** when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note:     *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column (“WITH REV.” or “WITHOUT REV.”)
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
RESULT	3	10			1.40×1.90×1.1=3.00

VREF = 131 kt. Therefore VAPP = 131 + 10 + 5 = 146 kt.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK		<b>ABNORMAL AND EMERGENCY PROCEDURES</b>			<b>80.15A</b>
					30 MAR 12
FAILURES	Flaps Lever Position for Landing	Δ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S ≥ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b>
		30 MAR 12

<b>TRIPPED C/B RE-ENGAGEMENT</b>
----------------------------------

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 24pt; font-weight: bold;">80.20</div> <div style="text-align: center;">30 MAR 12</div>
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------

### COMPUTER RESET

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor.

The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	CP-LVO <b>2/2</b>
		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |
|------------------------------------------------|--------------------------------|
| - α Floor                                      | - Engine Failure               |
| - Autopilot OFF                                | - No 'LAND' green by 350 ft RA |
| - Downgrade below required approach capability | - Autoland warning light       |
| - Amber Caution                                | - No "Flare" by 30 ft          |

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

		30 MAR 12

Intentionally left blank

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	<b>CP-AWO</b> <b>2/2</b> 30 MAR 12

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
BEFORE TAKEOFF Checklist	

# CONTAMINATED RUNWAY OPERATIONS

● **TAKEOFF**

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

● **MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING**

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note:     The maximum crosswind values are given without gust.

		30 MAR 12

Intentionally left blank

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF 3

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		730	760	800	840	890	970	1060	1160	1250
	WET		970	1040	1110	1180	1260	1340	1420	1500	1580
	COVERED WITH	STANDING WATER	1270	1360	1440	1560	1690	1810	1940	2070	2180
		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600

CORRECTION ON ACTUAL LANDING DISTANCE						
RUNWAY CONDITION	dry runway	wet runway	runway covered with			
			standing water	slush	compacted snow	ice
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %
per 10 kt headwind	No correction for headwind due to wind correction on approach speed					
per 10 kt tailwind	+17 %	+21 %	+24 %	+22 %	+16 %	+24 %
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+3 %
2 reversers operative	-5 %	-12 %	-15 %	-14 %	-12 %	-27 %
Per 5 kt speed increment (and no failure) add 8 % (all runways)						

Note:    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
Pressure altitude = 2 000 ft  
Approach speed = VLS + 5 kt  
Dry runway

Read from ALD table,  
ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
Pressure altitude correction: 3 x 2 = +6 %  
Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 x 1.06 x 1.08 = 1 020 m.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		690	730	760	790	830	890	980	1070	1150
	WET		890	950	1010	1080	1150	1220	1290	1360	1420

		ICE	2030	2170	2310	2450	2600	2740	2880	3030	3150

CORRECTION ON ACTUAL LANDING DISTANCE							
RUNWAY CONDITION	dry runway	wet runway	runway covered with				
			standing water	slush	compacted snow	ice	
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %	
per 10 kt headwind	No correction for headwind due to wind correction on approach speed						
per 10 kt tailwind	+18 %	+21 %	+22 %	+20 %	+17 %	+25 %	
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+2 %	
2 reversers operative	-5 %	-11 %	-14 %	-13 %	-11 %	-24 %	
Per 5 kt speed increment (and no failure) add 8 % (all runways)							

*Note:*    - THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

**EXAMPLE:** Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
 Pressure altitude = 2 000 ft  
 Approach speed = VLS + 5 kt  
 Dry runway

Read from ALD table,  
 ALD (0 ft , No wind, VLS, no reversers) = 830 m

Read from the Corrections table,  
 Pressure altitude correction: 3 × 2 = +6 %  
 Speed increment correction : +8 %

ALD (2 000 ft, No wind, VLS, no reversers) = 830 × 1.06 × 1.08 = 960 m.

AUTOLAND LANDING DISTANCE

WITH AUTOBRAKE - CONF 3

## COST INDEX FOR LONG RANGE CRUISE SPEED

### ALL ENGINES

For a quick determination of the  $CI_{LRC}$ , use:

-  $CI_{LRC} = 40$  kg/min in the FMGC.

or

-  $CI_{LRC} = 55$  (100 lb/h) in the FMGC.

## STANDARD DESCENT

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEI condition). The flight crew must still compute and monitor the actual fuel consumption.

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times \text{FPF}$$

This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$

This additional fuel must be added to the fuel predictions provided by the FMS.

Note: Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:

- Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or
- If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

$\text{FPF (HYD G SYS LO PR)} = 10 \%$

$\text{FPF (INOP SYS: L AIL)} = 8 \%$

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (10 \% + 8 \%)$

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times 8 \%$

	B+Y SYS LO PR	SPLR 2+3+4 R ELEV	Spoilers 2, 3 and 4 See Right elevator is failed RAT extended	3 % to 10 % See
L/G	SHOCK ABSORBER FAULT	L/G RETRACT	All landing gears are extended (Also refer to PRO-SPO-25-10)	180 %
	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT			
	DOORS NOT CLOSED	L/G DOOR	All landing gears doors are extended	15 %

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b> 30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

## FUEL PENALTY FACTORS/INOP SYS TABLE

SYS	INOP SYS	CONDITIONS	FUEL PENALTY FACTOR
F/CTL	L(R) AIL or L+R AIL	If one or both aileron(s) is/are indicated partially extended	8 %
	FLAPS	If Flaps are extended	80 %

	WINDSHIELD HEAT (L or R windshield)	1 for PF		
	WINDSHIELD WIPERS OR RAIN REPELLENT (if activated)	1 for PF		
	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
	ATTITUDE INDICATION (STBY )	1	1	1
DH INDICATION	1 for PNF			

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:**
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an ENG 1(2) OIL FILTER CLOG ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

Criteria: V2500-A5 Applicable to: B-HSJ					

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side).....OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side).....OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED.....OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER.....IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note: *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

## OEB17 Issue 1.0

### DUAL FM RESET UPON RADIAL FIX INFO ENTRY

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 169.

Several Operators reported that both FMS reset immediately after the flight crew inserted a FIX INFO radial that intercepted the F-PLN just prior to the last point of the approach (Missed Approach Point (MAP), or runway threshold). Therefore, this OEB is issued to provide the operational recommendations that should be applied, in order to help prevent this situation.

**Applicable to:**

All A318/A319/A320/A321 aircraft with FMS2 Pegasus :

- P1C8 MOD 31896, or
- P1C9 MOD 32222, or
- P1C11 MOD 34573, or
- P1I8 MOD 31897.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: 22-1090, P7520 Applicable to: B-HSJ				

## DUAL FM RESET UPON RADIAL FIX INFO ENTRY

### ECAM ENTRY

NONE

### PROCEDURE

#### PREVENTIVE PROCEDURE

Do not use the FIX INFO function with any radials that could intercept the F-PLN just before the last point of the approach (less than 0.1 nm).

Note: The last point of the approach corresponds to the runway threshold for an ILS approach, or to the Missed Approach Point (MAP) for a Non-Precision Approach (NPA).

#### RECOVERY PROCEDURE

If disengaged, consider reengagement of the AP/FD and ATHR.

While the FMS is recovering, consider using RMP backup tuning for navigation.

##### ■ If the F-PLN is not lost:

Normal FMS operation can be recovered by clearing the radial FIX INFO, and then by re-entering the GW/CG.

##### ■ If the F-PLN is lost:

When the FMS has automatically recovered, perform the associated procedures (*Refer to ABN-22 LOSS OF FMS DATA IN DESCENT/APPROACH (Severe Reset)*).

Intentionally left blank

## NO LOCALIZER OR GLIDE SLOPE CAPTURE IN APPROACH

Approved by: Head of Flight Operations Support and Services

## Reason for issue:

This OEB replaces the A320 OEB 184.

Several Operators experienced the following event: LOC\* (G/S\*) capture mode did not engage when intercepting the localizer (glide slope) during an ILS approach.

This OEB provides an explanation of the above-mentioned event, as well as the operational recommendations that the flight crew should apply, in order to intercept the ILS using LOC and G/S modes.

**Applicable to:**

Aircraft with Rockwell Collins Multi-Mode Receiver (MMR), P/N 822-1152-121 (MOD 26999 or MOD 30631)

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

<div> DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK</div>			OPERATIONS ENGINEERING BULLETINS		28.00A
					30 MAR 12
M	Localization	T	DU Title	DU identification	DU date

No bulletin found

## NO LOCALIZER OR GLIDE SLOPE CAPTURE IN APPROACH

### ECAM ENTRY

None

### PROCEDURE

In accordance with the FCOM Standard Operating Procedures (*Refer to FCOM/PRO-NOR-SOP-18 ILS Approach Pattern*), the flight crew should closely monitor the localizer and glide slope capture, for every ILS approach.

- **If LOC\* mode does not engage when expected, the flight crew should:**

Perform the ILS interception using the LOC raw data deviations. The FD and AP can be used in selected modes (HDG-V/S modes, or preferably TRK-FPA modes) for this purpose.

Consider changing the Master FMGC:

- **If the AP is engaged:**

Change the AP in command

*(If AP1+2 are engaged, change to AP2, by pressing the AP1 pb on the FCU to disengage AP1)*

- **If the AP is disengaged, and the FDs are engaged:**

Turn off FD1

Then, attempt to reengage the LOC and G/S modes, by pressing the APPR pb.

LOC\* (G/S\*) mode should engage as expected, and the ILS can then be flown in LOC and G/S modes. However, the flight crew should disregard the approach capability on the FMA, and perform only a CAT I approach with a manual landing.

Note: *If it is still not possible to intercept the ILS after changing the Master FMGC, the flight crew must perform an ILS approach using raw data. The AP/FD can be used in selected modes (HDG/VS, or preferably TRK/FPA). The flight crew should disarm the APPR (LOC) mode(s) by setting the APPR (LOC) pb to OFF on the FCU, and then perform a CAT I approach with a manual landing.*

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-31		Erroneous Vertical Profile During RNAV, LOC and LOC B/C Approaches	00013531.0003001	30 MAR 12
	Criteria: SA Applicable to: B-HSJ				

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

## **OEB36 Issue 1.0**

# **NO SRS ENGAGEMENT DURING GO AROUND IN THE CASE OF EPR MODE FAULT**

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 199.

One operator reported a case where, at takeoff, the Speed Reference System (SRS) mode did not engage, as expected while setting takeoff thrust. The aircraft was dispatched in N1 rated control mode (EPR control mode inoperative).

Investigation has shown that similar misbehavior also applies in the case of go-around with EPR control mode inoperative.

This OEB is issued to provide flight crews with an operational procedure in the case of a go-around with EPR control mode inoperative (EPR control mode failure in flight).

**Applicable to:**

All A320 family aircraft fitted with IAE engines and Flight Guidance (FG) "I9" (Thales/GE, MOD 34076) "I10" (Honeywell, MOD 35526) standard and subsequent.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## NO SRS ENGAGEMENT DURING GO AROUND IN THE CASE OF EPR MODE FAULT

### ECAM ENTRY

ENG 1(2) EPR MODE FAULT

### PROCEDURE

In the case of go-around with EPR control mode inoperative, perform a manual go-around with no FD:

Maximum landing capability is CAT 1.

Note: To perform a manual go-around with no FD, the PF simultaneously announces her/his intention, disengages the AP, applies TOGA and initiates the rotation.

GO-AROUND..... ANNOUNCE

AP (if engaged)..... OFF

BOTH FDs (if engaged)..... OFF

*Action performed by the PNF on PF request.*

THRUST LEVERS..... TOGA

ROTATION..... 15 ° OF PITCH

*Rotate to 12.5 ° in case of engine failure.*

FLAPS..... RETRACT ONE STEP

POSITIVE CLIMB..... ANNOUNCE

LDG GEAR UP..... ORDER

LDG GEAR..... SELECT UP

Adjust pitch to maintain VAPP

- **When appropriate:**

Set both FDs to ON (basic guidance modes engage)

Engage OP CLB and select appropriate speed and lateral mode

AP use as required

- **When reaching thrust reduction altitude:**

Set both thrust levers to CL detent

- **When reaching acceleration altitude:**

Resume normal acceleration and climb procedures.

Note: CLB or LVR CLB will not flash on the FMA as the A/THR is not available. The FMS does not engage the GO AROUND phase.

## OEB38 Issue 1.0

### ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: SA Applicable to: B-HSJ				

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

\*\*\*\*\* END OF RED OEB38 ISSUE 1.0 \*\*\*\*\*

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

 BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

## OEB43 Issue 2.0 F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:**

All A318/A319/A320/A321 Aircrafts.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF

*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10

*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED

*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

F/CTL SPOILER FAULT (Cont'd)

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above  $V_{FE_{NEXT}}$ , the flight crew should deselect A/THR, decelerate to  $V_{FE_{NEXT}}$ , and select CONF 1 when below  $V_{FE_{NEXT}}$ . When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD..... $V_{REF} + 10KT$

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers.....x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

## OEB44 Issue 2.0

### L/G GEAR NOT DOWNLOCKED

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 209.

This OEB is issued to provide operational recommendations in the case of L/G GEAR NOT DOWNLOCKED ECAM warning.

The illustration has been revised to improve the quality and the legibility.

**Applicable to:**

All A320 family aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## L/G GEAR NOT DOWNLOCKED

### ECAM ENTRY

L/G GEAR NOT DOWNLOCKED

### PROCEDURE

Apply the following procedure if the ECAM triggers the L/G GEAR NOT DOWNLOCKED warning:

#### L/G GEAR NOT DOWNLOCKED

*This warning appears, if the landing gear sequence is not completed after 30 seconds.*

L/G lever.....RECYCLE

•IF GEAR NOT DOWNLOCKED AFTER 2 MINUTES:

L/G GRAVITY EXTENSION PROC.....APPLY

STATUS

The status displayed on the ECAM is correct.

This table gives, for each delivered aircraft, the cross reference between:

- The Manufacturing Serial Number (MSN).
- The Fleet Serial Number (FSN) of the aircraft as known by AIRBUS S.A.S.
- The registration number of the aircraft as known by AIRBUS S.A.S.
- The aircraft model.

### **SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
 As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

### **TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

#### **PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

#### **PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

### **Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

### **ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

### **ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

		30 MAR 12

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

- |                 |                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 00, 01, 02, ... | : Numbering for ABN, GEN, OPS, OEB PROC sections                                                                                  |
| 01A, 03B, ...   | : Numbering and index (A, B, ...) for procedures written on several paper pages                                                   |
| 1/10, 3/5, ...  | : Numbering for NP-NP, FPE-SPO                                                                                                    |
| C1, C2          | : Index of the back cover page interior                                                                                           |
| C3              | : Index of the back cover page exterior                                                                                           |
| "BLANK"         | : Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page) |

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

## LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The "CAB PR LDG ELEV FAULT" message is displayed on the ECAM
- A "MAP NOT AVAIL" message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### ■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:

#### ● When the system has recovered:

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### ■ DESCENT (IF TIME PERMITS) :

#### ● When the system has recovered:

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● If one or more electrical latches (strikes) are faulty:

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● If two pressure sensors are faulty:

Automatic latch release is not available, in case of cockpit decompression.

● If no LED on the CKPT DOOR CONT panel is on:

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

		30 MAR 12

Intentionally left blank

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

■ **Repeat the following until landing configuration is reached:**

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered. In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.

● **As speed reduces through VFE NEXT:**

FLAPS LEVER..... ONE STEP DOWN

■ **When landing configuration is established:**

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

■ **IF SLATS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION**

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

■ **IF FLAPS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION:**

● **If FLAPS jammed at 0**

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

- Note:
- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
  - In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED						
Slats	Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
S = 0	NO LIMITATION	230 kt	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1						
S = 1						
1 < S ≤ 3	200 kt		200 kt	185 kt	177 kt	
S > 3	177 kt		177 kt	177 kt	177 kt	

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>
		30 MAR 12

Intentionally left blank

**SIDESTICK/RUDDER PEDALS STIFF**

Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:

- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or
- One sidestick and the rudder pedals at the same time.

The piloting technique remains the same: The aircraft remains responsive.  
However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.

AP DISENGAGEMENT..... CONFIRM

CONSIDER TRANSFERRING CONTROL TO PNF

- **FOR DECRAB, ROLLOUT, OR ENGINE FAILURE**  
BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

## STABILIZER JAM

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
 The flight control normal law remains active in this case and there is no ECAM warning.

AP..... OFF  
 MAN PITCH TRIM.....CHECK

*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

- **IF MAN TRIM AVAIL:**

TRIM FOR NEUTRAL ELEV

*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

**APPR PROC**

- **IF MAN TRIM NOT AVAIL:**

FOR LDG.....USE FLAP 3

*Do not select configuration full so as not to degrade the handling qualities.*

GPWS LDG FLAP 3..... ON

CAT 2 INOP

FUEL IMBALANCE

FOB..... CHECK  
*Compare the FOB + FU, with the FOB at departure.  
If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.*

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. <i>Refer to ABN-28 FUEL LEAK.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON

- **On the lighter side and in the center tank:**  
FUEL PUMPS.....OFF
- **When fuel is balanced:**  
FUEL PUMPS (WING + CTR)..... ON  
FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>28.02A</b>
		30 MAR 12

**FUEL LEAK (Cont'd)**

ENGINE RESTART..... CONSIDER

<b>CAUTION</b>	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.
----------------	----------------------------------------------------------------------------------------------------------------------

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

- **If fuel smell in the cabin:**  
 APU (if ON)..... OFF  
*This prevents additional fuel loss through the APU feeding line.*
- **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**  
 CTR TK PUMP 1+2..... ON

**FOR LANDING**

<b>CAUTION</b>	Do not use reversers.
----------------	-----------------------

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or diagonal line),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, Upper ECAM or MCDU 1 is(are) affected.

GEN 1.....OFF

#### ■ If DUs do not stop flashing:

GEN 1.....ON

#### ■ If DUs stop flashing:

GEN 1.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM.....CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START.....CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2.....OFF

#### ■ If DUs do not stop flashing:

GEN 2.....ON

#### ■ If DUs stop flashing:

GEN 2.....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM.....CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR.....AS RQRD

APU START.....CONSIDER

### ■ AFFECTED DU IS BLANK or the DISPLAY IS DISTORTED:

DU (affected).....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected).....USE

*Transfer SD to F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected).....USE

### ■ DIAGONAL LINE ON THE AFFECTED DU:

This failure may be caused by a DMC FAULT, or a communication interruption between the DMC and DU.

EIS DMC SWITCHING.....AS RQRD

DISPLAY UNIT FAILURE (Cont'd)

- **If unsuccessful:**  
DU (affected)..... OFF THEN ON  
  
*Note:     The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
- **INVERSION OF THE EWD AND THE SD:**  
ECAM UPPER DISPLAY .....OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

		30 MAR 12

Intentionally left blank

LOSS OF BRAKING

- IF NO BRAKING AVAILABLE:  
REV ..... MAX  
BRAKE PEDALS..... RELEASE  
A/SKID & N/W STRG..... OFF  
BRAKE PEDALS..... PRESS  
MAX BRK PR..... 1000 PSI
- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <b>WHEEL SD</b> page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <b>L/G GEAR NOT DOWN</b> ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### **PREPARATION**

CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF

*Consider fuel reduction to a safe minimum.*

● **If NOSE L/G abnormal:**

CG location (if possible).....AFT  
 - 10 passengers from front to rear moves the CG roughly 4 % aft.  
 - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.

● **If one MAIN L/G abnormal:**

FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*

OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE  
 - Loose equipment secured.  
 - Survival equipment prepared.  
 - Belts and shoulder harness locked.

### **APPROACH**

GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI

● **If one or both MAIN L/G abnormal:**

GROUND SPOILERS.....DO NOT ARM

### **BEFORE LANDING**

RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER

● **If the external light condition is poor at landing:**

DOMELT.....DIM

### **FLARE, TOUCH DOWN AND ROLL OUT**

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.  
 Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

## LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

● **If NOSE L/G abnormal:**

NOSE..... MAINTAIN UP

*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*

BRAKES (compatible with elevator efficiency)..... APPLY

ENG MASTERS..... OFF

*Shutdown the engines before nose impact.*

● **If one MAIN L/G abnormal:**

ENG MASTERS..... OFF

*At touchdown, shut down both engines.*

FAILURE SIDE WING..... MAINTAIN UP

*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*

DIRECTIONAL CONTROL..... MAINTAIN

*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

● **If both MAIN L/G abnormal:**

ENG MASTERS..... OFF

*Shut down the engines in the flare, before touchdown.*

PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

### WHEN A/C STOPPED

ENG (all) and APU FIRE pushbutton..... PUSH

*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*

ENG (all) and APU AGENT..... DISCH

■ **If Evacuation required:**

EVACUATION..... INITIATE

- All emergency and passenger doors may be used to evacuate the aircraft.

- Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

■ **If Evacuation not required:**

CABIN CREW and PASSENGERS (PA)..... NOTIFY

*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

## ADR 1 + 2 + 3 FAULT

The ECAM does not display this procedure. In the case of a triple ADR failure, the ECAM only displays dual ADR warnings.

ADR P/B (all)..... OFF  
STBY INST..... USE

Note: Disregard ECAM actions for AIR DATA SWTG and ATC since these have no effect in the case of a total loss of ADRs.

### ASSOCIATED PROCEDURES

## F/CTL ALTN LAW (PROT LOST)

MAX SPEED..... 320/0.82

See the following table for the IAS/M relationship for 0.82

FL	390	370	350	330	310	290	280 and below
MAX SPD	252	265	278	290	305	315	320

WHEN L/G DN: DIRECT LAW

At landing gear extension, control reverts to direct law in pitch, as well as in roll.

Note: Use manual control of cabin pressurization.

MODE SEL.....MAN  
MAN V/S CTL.....AS RQRD

### STATUS

MAX SPEED..... 320/0.82

RUD WITH CARE ABV 160 kt

See <sup>(1)</sup>

## NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 °,
- 0.9 min for latitudes at or above 55 ° and below 70 °,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

● **If the message occurs during ILS/LOC approach (LOC green):**

DISREGARD it.

● **If the message occurs in climb, cruise, or descent:**

CHECK navigation accuracy, using raw data.

■ **If the check is positive:**

NAV mode and ND ARC/ROSE NAV may be used.

■ **If the check is negative:**

HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

■ **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**

Use the associated FD/AP.

■ **If not:**

Deselect GPS and revert to basic information.

● **If the message occurs during a Non Precision Approach (NPA):**

■ **Overlay approach:**

SELECT HDG, or TRK, and use raw data.

■ **GPS or RNAV approach:**

GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.  
During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
*ALIGN light on during 30 s.*  
*ATT MODE displayed on CDU.*
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

■ **MCDU INITIALIZATION:**

- DATA (MCDU KEY)..... PRESS  
*The DATA INDEX page is displayed.*
- IRS MONITOR (2L KEY).....PRESS  
*The IRS MONITOR page is displayed.*
- A/C HEADING..... ENTER  
*The flight crew must enter the heading in the SET HDG field (5R KEY).*

■ **CDU INITIALIZATION:**

Depending on the CDU keyboard installed, an “H” may be written on the “5” key:

■ **If “H” is written on the “5” key:**

- H KEY.....PRESS  
*Degree marker, 0 decimal point, ENT and CLR lights come on.*
- A/C HEADING..... ENTER

■ **If “H” is not written on the “5” key:**

- A/C HEADING..... ENTER  
*Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.*  
*Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.*  
*Heading will be displayed on the associated ND.*  
*“HDG–ATT MODE” will be displayed on CDU.*

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and VMAX.*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s).....OFF  
 REMAINING AIR DATA.....CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR.....KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs.....OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF.....USE FLAP 3

APP SPD.....VLS +10

LDG DIST PROC.....APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST.....CLB

FLAPS.....RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

## ENG DUAL FAILURE - FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :

**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
 THR LEVERS..... IDLE  
 FAC 1.....OFF THEN ON  
 ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.

OPTIMUM RELIGHT SPD.....280 KT

*Note: In the case of an "ENG DUAL FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

*In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:*

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

*At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*

VHF1/HF1  /ATC1.....USE

ATC.....NOTIFY

● **IF NO RELIGHT AFTER 30 SEC:**

ENG MASTERS.....OFF 30 S/ON

*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*

● **IF UNSUCCESSFUL:**

CREW OXY MASKS (Above FL 100).....ON

● **WHEN BELOW FL 250**

APU (IF AVAIL).....START

● **WHEN BELOW FL 200**

WING ANTI ICE.....OFF

APU BLEED.....ON

ENG MASTERS (one at a time).....OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
COMMERCIAL.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST

*Engine Agent 2 is not available.*  
EVACUATION..... INITIATE  
ELT  ..... CHECK EMITTING  
*If not, switch on the transmitter.*

## ENG DUAL FAILURE - NO FUEL REMAINING

The flight crew should apply this paper procedure and then, if time permits, clear ECAM warnings and check the ECAM STATUS page.

THRUST LEVERS..... IDLE

FAC 1.....OFF THEN ON

*Resetting FAC 1 also enables rudder trim recovery, even if no indication is available.*

OPTIMUM SPEED.....220 KT/GREEN DOT

*Initially, fly 220 kt, because the PFD may not display the correct green dot speed. Then fly the green dot speed according to the following table:*

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

*At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind). Average rate of descent is approximately 1 600 ft/min .*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached or the most appropriate place for a forced landing/ditching.*

EMER ELEC POWER (if EMER GEN not in line).....MAN ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION	External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :
---------	---------------------------------------------------------------------------------------------------------------------------------------------

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

● When burning has stopped :

MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1 ≥ 5 units, N2 ≥ 5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0

45	59.0	57.0	55.0					
50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE
<i>Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.</i>	
NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN
<i>Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.</i>	
DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

BOMB ON BOARD (Cont'd)

- **When at CAB ALT+ 2 500 ft:**

CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**  
EVACUATION..... INITIATE  
*Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**  
CABIN CREW and PASSENGERS (PA)..... NOTIFY

CABIN PROCEDURES

If a suspect device is found in the cabin:

WARNING	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
WARNING	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
CAUTION	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

EOD PERSONNEL ON BOARD..... CHECK  
*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

BOMB..... DO NOT OPEN  
BOMB..... DO NOT CUT WIRES  
BOMB..... SECURE AGAINST SLIPPING  
BOMB..... AVOID SHOCKS  
*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

PASSENGERS..... LEAD AWAY FROM BOMB  
*Move passengers at least 4 seat rows away the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*  
*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*  
*Seat backs and tray tables must be in their full upright position.*  
*Service items may need to be collected in order to secure tray tables.*

 <div>DRAGONAIR A320/A321 QUICK REFERENCE HAND BOOK</div>	<div>ABNORMAL AND EMERGENCY PROCEDURES</div>	<div>80.02B</div> <div>30 MAR 12</div>
--------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------	----------------------------------------

BOMB ON BOARD (Cont'd)

PORTABLE ELECTRONIC DEVICES..... SWITCH OFF

*The cabin crews must command passengers to switch off all portable electronic devices.*

BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

● If the bomb can be moved:

RH AFT CABIN DOOR SLIDE..... DISARM

LEAST RISK BOMB LOCATION (LRBL)..... PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

CAUTION

DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

BOMB INDICATION LINE..... POSITION

*Note:* *A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m ) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

BOMB..... MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

CAUTION

Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

## BOMB ON BOARD (Cont'd)

LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

**CAUTION**

**DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.**

Build up at 25 cm (10 in ) of wetted material around the sides and on top of the bomb.

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

PASSENGERS.....MOVE/ADVISE

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

CABIN CREW..... NOTIFY COCKPIT CREW

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

 <div>DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK</div>	ABNORMAL AND EMERGENCY PROCEDURES	80.02D
		30 MAR 12
BOMB ON BOARD (Cont'd)		
EVACUATION/DISEMBARKATION.....EXECUTE		
<i>Evacuate through normal and emergency exits on the opposite side of the “bomb” location. Do not use the door just opposite the “bomb”.</i>		
<i>Use all available airport facilities to disembark without delay.</i>		

## DITCHING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.*

### **PREPARATION**

EVACUATION.....INITIATE

	FORCED LANDING (Cont'd)	
--	-------------------------	--

ELT..... CHECK EMITTING <i>If not, switch on the transmitter.</i>		
■ <b>If Evacuation not required:</b>		
CABIN CREW and PASSENGERS (PA)..... NOTIFY		

## EMER DESCENT

### IMMEDIATE ACTION

CREW OXY MASKS..... ON  
 EMER DESCENT.....ANNOUNCE(PA)

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS.....ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

**CAUTION** Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note: The recommendation is to descend with the autopilot engaged.  
 Use of the autopilot is also permitted in EXPEDITE mode .

ENG MODE SEL.....IGN

ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note: Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● **In the final approach stages**

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.

Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● **At main landing gear touchdown**

REVERSE THRUST..... USE MAX AVAILABLE

● **After nosewheel touchdown**

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● **Landing complete**

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58
20	83	81	78	74	71	66	61	56
25	83	81	78	74	70	64	59	
30	83	81	78	73	67			
35	83	81	76	70	65			
40	83	80	73	67				
45	82	76	70					
50	79	73						
55								

# STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

NOSE DOWN PITCH CONTROL..... APPLY  
*This will reduce angle of attack*

*Note:*     In case of lack of pitch down authority, reducing thrust may be necessary.

BANK..... WINGS LEVEL

● **When out of stall (no longer stall indications) :**

THRUST..... INCREASE SMOOTHLY AS NEEDED

*Note:*     In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

SPEEDBRAKES..... CHECK RETRACTED

FLIGHT PATH..... RECOVER SMOOTHLY

● **If in clean configuration and below 20 000 ft:**

FLAP 1..... SELECT

*Note:*     If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

# STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

THRUST..... TOGA

At the same time:

PITCH ATTITUDE..... 15 °

BANK..... WINGS LEVEL

*Note:*     When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

TAILSTRIKE

In the event of a tailstrike, apply the following procedure:

LAND ASAP

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.  
Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

VOLCANIC ASH ENCOUNTER

- If the aircraft enters a volcanic ash cloud:
 

180 ° TURN.....	INITIATE
ATC.....	NOTIFY
A/THR.....	OFF
THRUST (conditions permitting).....	REDUCE
CREW OXYGEN MASKS.....	ON/100 %/EMER
CABIN CREW.....	NOTIFY
PASSENGER OXYGEN.....	AS RQRD
ENG ANTI ICE.....	ON
WING ANTI ICE.....	ON
PACK FLOW.....	HI

*Note:* If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

- |                           |         |
|---------------------------|---------|
| APU.....                  | START   |
| ENGINE PARAMETERS.....    | MONITOR |
| AIRSPEED INDICATIONS..... | MONITOR |

If airspeed is unreliable or lost,Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.

*Note:* If all engines flame out and speed indications are lost,Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

*Note:* If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

- |                         |         |
|-------------------------|---------|
| CAB PRESS MODE SEL..... | MAN     |
| MAN V/S CTL.....        | FULL UP |

Due to the increased noise level, pay particular attention to visual warnings.

## WINDSHEAR AHEAD

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear.

**Note:** When a predictive windshear alert ("WINDSHEAR AHEAD" or "GO AROUND WINDSHEAR AHEAD") is triggered, if the flight crew makes a positive verification that no hazard exists, then the alert may be disregarded, as long as:

- There are no other signs of possible windshear conditions, and
- The reactive windshear system is operational.

*Known cases of spurious predictive windshear alerts have been reported at some airports, during either takeoff or landing, due to the specific obstacle environment. However, always rely on any reactive windshear ("WINDSHEAR").*

### W/S AHEAD RED

#### ■ Takeoff

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

##### ● Before takeoff

Delay takeoff, or select the most favorable runway.

##### ● During the takeoff run

Reject takeoff.

**Note:** Predictive windshear alerts are inhibited above 100 kts until 50 ft.

##### ● When airborne

THR LEVERS.....TOGA

*As usual, the slat/flap configuration can be changed, provided the windshear is not entered.*

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if required.*

- Note:**
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD is not available, use a pitch initial attitude up to 17.5 °. If necessary to minimize the loss of height, increase this pitch attitude.

#### ■ Landing

Associated with an aural synthetic voice "GO AROUND, WINDSHEAR AHEAD".

GO AROUND.....PERFORM

*This includes the use of full backstick, if required.*

- Note:**
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD is not available, use a pitch initial attitude up to 17.5 °. If necessary to minimize the loss of height, increase this pitch attitude.

### W/S AHEAD AMBER

Apply precautionary measures, as indicated below:

#### ■ Before TAKEOFF

Delay takeoff until conditions improve.

Evaluate takeoff conditions :

- Using observations and experience.
- Checking weather conditions.

Select the most favorable runway (considering location of the likely windshear).

## WINDSHEAR AHEAD (Cont'd)

Use the weather radar or the predictive windshear system before commencing takeoff to ensure that the flight path clears any potential problem areas.

Select TOGA thrust.

Monitor closely airspeed and airspeed trend during the takeoff run for early signs of windshear.

### ■ **During Approach**

Delay landing or divert to another airport until conditions are more favorable.

Evaluate condition for a safe landing by :

- Using observations and experience.
- Checking weather conditions.

Use the weather radar.

Select the most favorable runway, considering also which has the most appropriate approach aid.

Select FLAPS 3.

Use managed speed in the approach phase.

Check both FDs engaged in ILS, FPA or V/S.

Engage the autopilot, for a more accurate approach and earlier recognition of deviation from the beam, when ILS is available.

Note: - When it is using the GS mini-function, associated with managed speed, the system will carry extra speed in strong wind conditions.  
 - In case of strong or gusty crosswind greater than 20 kt, Refer to FPE-IFL VAPP Determination.

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ **At takeoff**

#### ■ **If before V1**

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ **If after V1**

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

Note: 1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.  
 2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

## WINDSHEAR (Cont'd)

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA.....SET OR CONFIRM

AP (if engaged).....KEEP

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if demanded.*

Note:

1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.

CLOSELY MONITOR FLIGHT PATH AND SPEED.

RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	ABNORMAL AND EMERGENCY PROCEDURES	80.11
		30 MAR 12
WINDSHIELD/WINDOW ARCING		
<p>Affected WINDOW/WINDSHIELD ANTI ICE C/B.....PULL</p> <p><i>Pull the circuit breaker of the affected window/windshield heating system, in case of :</i></p> <ul style="list-style-type: none"><li>- <i>Electrical arcing of the cockpit windshield/window, or</i></li><li>- <i>Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.</i></li></ul> <p><i>On the rear C/B panel :</i></p> <ul style="list-style-type: none"><li>• ANTI ICE L WSHLD C/B AF10 (123VU)</li><li>• ANTI ICE R WSHLD C/B AF03 (123VU)</li><li>• ANTI ICE/WINDOWS L C/B X14 (122VU)</li><li>• ANTI ICE/WINDOWS R C/B W14 (122VU)</li></ul>		

## WINDSHIELD/WINDOW CRACKED

**DIAGNOSIS OF INNER PLY.....PERFORM**

*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation

*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

**MAX FL..... 230/MEA**

*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain  $\Delta P$  5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note: The following procedure allows maintaining  $\Delta P$  5 PSI in manual cabin pressure mode.

**CAB PRESS MODE SEL..... MAN**

**MAN V/S CTL..... AS RQRD**

Set the cabin altitude, according to the table below:

$\Delta P = 5$ PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

**CAB PRESS MODE SEL..... AUTO**

Note: *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

**CAB PRESS MODE SEL..... MAN**

**MAN V/S CTL..... FULL UP**

*Due to the increased noise level, pay particular attention to visual warnings.*

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK		<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.13</b>  30 MAR 12
<b>ECAM ADVISORY CONDITIONS</b>			
SYSTEM	CONDITIONS	RECOMMENDED ACTION	
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)	
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control	
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control	
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.	
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>	
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)	
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.	
APU	EGT > EGT MAX -33 °C (inhibited during APU start)		
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.	
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"><li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li><li>- If oil pressure is below 60 PSI (red indication), without the <u>ENG OIL LO PR</u> warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li></ul> In both cases, monitor other engine parameters, especially oil temperature and oil quantity.	
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.	
	OIL TEMP T > 155 °C	An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.  <u>Note:</u> If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.  In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended: 1. <u>Low Speed-</u> Increase engine speed to increase fuel flow, and thereby cool IDG oil. 2. <u>High Speed-</u> Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.	
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.	
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.	
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).	

## VAPP CALCULATION

### VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

$$VAPP = VREF + \Delta VREF + APPR COR$$

=

VREF												
Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78	
VREF (KT) = VLS CONF FULL	CG < 25%	108	113	118	123	127	131	136	140	144	148	149
	CG ≥ 25%	106	111	116	121	125	129	134	138	142	146	147

+

$\Delta VREF^{(1)}$

+

APPRoach CORrection		
if $\Delta VREF \leq 10$ kt	if $10 \text{ kt} < \Delta VREF < 20$ kt	if $\Delta VREF \geq 20$ kt
APPR COR is the Highest of		
5 kt * if A/THR ON and / or in case of ice accretion**	1/3 Headwind Max = 15 kt	APPR COR = 1/3 Headwind Max = 10 kt
APPR COR + $\Delta VREF$ limited to 20 kt		APPR COR = 0 kt

\* Multiply the landing distance by an additional factor of 1.1

\*\* In CONF3, add another 5 knot speed increment and multiply the landing distance by an additional factor of 1.2 (instead of 1.1)

=

$$VAPP = VREF + \Delta VREF + APPR COR$$

TO BE INSERTED IN THE MCDU PERF APPR PAGE

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

#### EXAMPLE OF VAPP CALCULATION:

Failure : ALTN LAW  
Flight Conditions : Autothrust ON, ice accretion  
Landing Configuration : CONF 3  
Headwind : 12 kt  
Landing Weight/CG : 48 t/25 %  
VREF determined from the landing weight : 116 kt  
VREF correction due to the failure ( $\Delta VREF$ ) : 10 kt

As  $\Delta VREF$  is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- $5+5 = 10$  kt (ice accretion and landing in CONF 3)
- $1/3 \text{ Headwind} = 12 \text{ kt} / 3 = 4$  kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

$VAPP = VREF + \Delta VREF + APPR CORR = 116 + 10 + 10 = 136$  kt

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.15</b>  30 MAR 12
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

<b>USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES</b>
---------------------------------------------------------

## USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors “WITHOUT REV”** when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors “WITH REV”** when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note: *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

## LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

## LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column (“WITH REV.” or “WITHOUT REV.”)
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
	3	10			1.40×1.90×1.1=3.00
RESULT	3	10			

$VREF = 131\text{ kt.}$  Therefore  $VAPP = 131 + 10 + 5 = 146\text{ kt.}$

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.15A</b>
		30 MAR 12

FAILURES	Flaps Lever Position for Landing	$\Delta$ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S $\geq$ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b>
		30 MAR 12

<b>TRIPPED C/B RE-ENGAGEMENT</b>
----------------------------------

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.20</b>
		30 MAR 12

<b>COMPUTER RESET</b>
-----------------------

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor. The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	COMPANY PROCEDURES	CP-LVO <b>2/2</b>
		30 MAR 12

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |
|------------------------------------------------|--------------------------------|
| - α Floor                                      | - Engine Failure               |
| - Autopilot OFF                                | - No 'LAND' green by 350 ft RA |
| - Downgrade below required approach capability | - Autoland warning light       |
| - Amber Caution                                | - No "Flare" by 30 ft          |

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
 Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	<b>CP-AWO</b> <b>2/2</b> 30 MAR 12

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
BEFORE TAKEOFF Checklist	

# CONTAMINATED RUNWAY OPERATIONS

● **TAKEOFF**

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

● **MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING**

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note:     The maximum crosswind values are given without gust.

LOW TEMPERATURE ALTIMETRY

Part A chapter 8 refers.

When temperature at the aerodrome is below the ISA value, it is the responsibility of the Commander to consider the effect of temperature on the minimum and reference altitudes. If corrections are to be made, the guidelines below shall be used.

- **CORRECTIONS TO MSA**
  
- **CORRECTIONS TO ALTITUDES BELOW MSA**

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF 3

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		730	760	800	840	890	970	1060	1160	1250
	WET		970	1040	1110	1180	1260	1340	1420	1500	1580
	COVERED WITH	STANDING WATER	1270	1360	1440	1560	1690	1810	1940	2070	2180
		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600

CORRECTION ON ACTUAL LANDING DISTANCE						
RUNWAY CONDITION	dry runway	wet runway	runway covered with			
			standing water	slush	compacted snow	ice
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %
per 10 kt headwind	No correction for headwind due to wind correction on approach speed					
per 10 kt tailwind	+17 %	+21 %	+24 %	+22 %	+16 %	+24 %
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+3 %
2 reversers operative	-5 %	-12 %	-15 %	-14 %	-12 %	-27 %
Per 5 kt speed increment (and no failure) add 8 % (all runways)						

Note:    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
Pressure altitude = 2 000 ft  
Approach speed = VLS + 5 kt  
Dry runway

Read from ALD table,  
ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
Pressure altitude correction: 3 × 2 = +6 %  
Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 × 1.06 × 1.08 = 1 020 m.

**LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL**

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78

# COST INDEX FOR LONG RANGE CRUISE SPEED

**ALL ENGINES**

- For a quick determination of the  $CI_{LRC}$ , use:
- $CI_{LRC}$  = 40 kg/min in the FMGC.
  - or
  - $CI_{LRC}$  = 55 (100 lb/h) in the FMGC.

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEI condition). The flight crew must still compute and monitor the actual fuel consumption.

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOB at DEST}) \times \text{FPF}$$

This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOB at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$

This additional fuel must be added to the fuel predictions provided by the FMS.

Note: Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:

- Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or
- If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

FPF (HYD G SYS LO PR) = 10 %

FPF (INOP SYS: L AIL) = 8 %

Therefore, ADDITIONAL FUEL = (FOB - EFOB at DEST) x (10 % + 8 %)

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore, ADDITIONAL FUEL = (FOB - EFOB at DEST) x 8 %

	B+Y SYS LO PR	SPLR 2+3+4 R ELEV	Spoilers 2, 3 and 4 See Right elevator is failed RAT extended	3 % to 10 % See
	SHOCK ABSORBER FAULT	L/G RETRACT	All landing gears are extended (Also refer to PRO-SPO-25-10)	180 %
L/G	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT	L/G DOOR	All landing gears doors are extended	15 %
	DOORS NOT CLOSED			

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b> 30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

## FUEL PENALTY FACTORS/INOP SYS TABLE

SYS	INOP SYS	CONDITIONS	FUEL PENALTY FACTOR
F/CTL	L(R) AIL or L+R AIL	If one or both aileron(s) is/are indicated partially extended	8 %
	FLAPS	If Flaps are extended	80 %
	SLATS	If Slats are extended	60 %
	SLATS+FLAPS	If Slats and Flaps are extended	100 %
L/G	L/G DOOR	All landing gears doors are extended	15 %

	"AP OFF" ECAM WARNING	1	1	2
	"AUTOLAND" LIGHT	1	1	1
	RUDDER TRAVEL LIMIT SYSTEM	1 required for autoland with crosswind higher than 12 kt		
	WINDSHIELD HEAT (L or R windshield)	1 for PF		
	WINDSHIELD WIPERS OR RAIN REPELLENT (if activated)	1 for PF		
	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
	ATTITUDE INDICATION (STBY )	1	1	1
DH INDICATION	1 for PNF			

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:**
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an ENG 1(2) OIL FILTER CLOG ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-11		"ENG 1(2) OIL FILTER CLOG" ECAM Caution During Flight	00013213.0001001	30 MAR 12
Criteria: V2500-A5 Applicable to: B-HSK					

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side)..... OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side)..... OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED..... OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER..... IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note:     *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

## OEB17 Issue 1.0

### DUAL FM RESET UPON RADIAL FIX INFO ENTRY

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 169.

Several Operators reported that both FMS reset immediately after the flight crew inserted a FIX INFO radial that intercepted the F-PLN just prior to the last point of the approach (Missed Approach Point (MAP), or runway threshold). Therefore, this OEB is issued to provide the operational recommendations that should be applied, in order to help prevent this situation.

**Applicable to:**

All A318/A319/A320/A321 aircraft with FMS2 Pegasus :

- P1C8 MOD 31896, or
- P1C9 MOD 32222, or
- P1C11 MOD 34573, or
- P1I8 MOD 31897.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## DUAL FM RESET UPON RADIAL FIX INFO ENTRY

### ECAM ENTRY

NONE

### PROCEDURE

#### PREVENTIVE PROCEDURE

Do not use the FIX INFO function with any radials that could intercept the F-PLN just before the last point of the approach (less than 0.1 nm).

*Note: The last point of the approach corresponds to the runway threshold for an ILS approach, or to the Missed Approach Point (MAP) for a Non-Precision Approach (NPA).*

#### RECOVERY PROCEDURE

If disengaged, consider reengagement of the AP/FD and ATHR.

While the FMS is recovering, consider using RMP backup tuning for navigation.

##### ■ If the F-PLN is not lost:

Normal FMS operation can be recovered by clearing the radial FIX INFO, and then by re-entering the GW/CG.

##### ■ If the F-PLN is lost:

When the FMS has automatically recovered, perform the associated procedures (*Refer to ABN-22 LOSS OF FMS DATA IN DESCENT/APPROACH (Severe Reset)*).

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: SA Applicable to: B-HSK				

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

## OEB36 Issue 1.0

# NO SRS ENGAGEMENT DURING GO AROUND IN THE CASE OF EPR MODE FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 199.

One operator reported a case where, at takeoff, the Speed Reference System (SRS) mode did not engage, as expected while setting takeoff thrust. The aircraft was dispatched in N1 rated control mode (EPR control mode inoperative).

Investigation has shown that similar misbehavior also applies in the case of go-around with EPR control mode inoperative.

This OEB is issued to provide flight crews with an operational procedure in the case of a go-around with EPR control mode inoperative (EPR control mode failure in flight).

**Applicable to:**

All A320 family aircraft fitted with IAE engines and Flight Guidance (FG) "I9" (Thales/GE, MOD 34076) "I10" (Honeywell, MOD 35526) standard and subsequent.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## NO SRS ENGAGEMENT DURING GO AROUND IN THE CASE OF EPR MODE FAULT

### ECAM ENTRY

ENG 1(2) EPR MODE FAULT

### PROCEDURE

In the case of go-around with EPR control mode inoperative, perform a manual go-around with no FD:

Maximum landing capability is CAT 1.

Note: To perform a manual go-around with no FD, the PF simultaneously announces her/his intention, disengages the AP, applies TOGA and initiates the rotation.

GO-AROUND..... ANNOUNCE

AP (if engaged)..... OFF

BOTH FDs (if engaged)..... OFF

Action performed by the PNF on PF request.

THRUST LEVERS..... TOGA

ROTATION..... 15 ° OF PITCH

Rotate to 12.5 ° in case of engine failure.

FLAPS..... RETRACT ONE STEP

POSITIVE CLIMB..... ANNOUNCE

LDG GEAR UP..... ORDER

LDG GEAR..... SELECT UP

Adjust pitch to maintain VAPP

- **When appropriate:**

Set both FDs to ON (basic guidance modes engage)

Engage OP CLB and select appropriate speed and lateral mode

AP use as required

- **When reaching thrust reduction altitude:**

Set both thrust levers to CL detent

- **When reaching acceleration altitude:**

Resume normal acceleration and climb procedures.

Note: CLB or LVR CLB will not flash on the FMA as the A/THR is not available. The FMS does not engage the GO AROUND phase.

## OEB38 Issue 1.0

# ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

\*\*\*\*\* END OF RED OEB38 ISSUE 1.0 \*\*\*\*\*

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

### ECAM ENTRY

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

### PROCEDURE

Apply the corresponding procedures if one of the following ECAM caution is triggered:

- AIR ENG 1(2) BLEED ABNORMAL PR
- AIR ENG 1(2) BLEED FAULT

#### AIR ENG 1(2) BLEED ABNORMAL PR

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED page.....SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

##### ■ If Wing Anti-Ice is ON

##### ● If both PACKS are ON

PACK (affected bleed side).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

##### ● If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:

BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

#### AIR ENG 1(2) BLEED FAULT

ENG BLEED affected..... OFF

##### ■ If Wing Anti-Ice is OFF

PACK FLOW..... LO (A319/A320)  
ECON FLOW.....ON (A321)  
AFT CARGO HOT AIR (if installed).....OFF  
X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

<b>AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT (Cont'd)</b>
--------------------------------------------------------------------------------

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
PACK (on the first affected bleed side)..... OFF

*Note: If Wing Anti-Ice is required (icing conditions) while operating with one PACK, consider switching OFF the remaining pack, if aircraft's altitude permits.*

■ If Wing Anti-Ice is ON

- If both PACKS are ON  
PACK (affected bleed side).....OFF

X BLEED..... OPEN  
BLEED Page..... SELECT and MONITOR

- If the precooler outlet temperature of the remaining bleed exceeds 240 °C within 2 min after X BLEED valve opening:  
BLEED AIR DEMAND.....REDUCE

*Consider reducing the bleed air demand, by, depending on the flight conditions:*

- Switching OFF the remaining pack (if aircraft's altitude permits), or
- Switching OFF the Wing Anti-Ice system (if no longer icing conditions).

## OEB43 Issue 2.0 F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:**

All A318/A319/A320/A321 Aircrafts.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF

*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10

*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED

*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

F/CTL SPOILER FAULT (Cont'd)

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above VFE<sub>NEXT</sub>, the flight crew should deselect A/THR, decelerate to VFE<sub>NEXT</sub>, and select CONF 1 when below VFE<sub>NEXT</sub>. When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD.....VREF + 10KT

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers..... x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

This table gives, for each delivered aircraft, the cross reference between:

- The Manufacturing Serial Number (MSN).
- The Fleet Serial Number (FSN) of the aircraft as known by AIRBUS S.A.S.
- The registration number of the aircraft as known by AIRBUS S.A.S.
- The aircraft model.

M <sup>(1)</sup>	MSN	FSN	Registration Number	Model

IMPORTANT

**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

**TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

**PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

**PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

**Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

**ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

**ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

- |                 |                                                                                                                                   |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 00, 01, 02, ... | : Numbering for ABN, GEN, OPS, OEB PROC sections                                                                                  |
| 01A, 03B, ...   | : Numbering and index (A, B, ...) for procedures written on several paper pages                                                   |
| 1/10, 3/5, ...  | : Numbering for NP-NP, FPE-SPO                                                                                                    |
| C1, C2          | : Index of the back cover page interior                                                                                           |
| C3              | : Index of the back cover page exterior                                                                                           |
| "BLANK"         | : Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page) |

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

## **LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)**

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The “CAB PR LDG ELEV FAULT” message is displayed on the ECAM
- A “MAP NOT AVAIL” message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### **■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:**

#### **● When the system has recovered:**

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### **■ DESCENT (IF TIME PERMITS) :**

#### **● When the system has recovered:**

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
 In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● **If one or more electrical latches (strikes) are faulty:**

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● **If two pressure sensors are faulty:**

Automatic latch release is not available, in case of cockpit decompression.

● **If no LED on the CKPT DOOR CONT panel is on:**

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

■ **Repeat the following until landing configuration is reached:**

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered.  
*In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

● **As speed reduces through VFE NEXT:**

FLAPS LEVER..... ONE STEP DOWN

■ **When landing configuration is established:**

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

■ **IF SLATS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION**

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

■ **IF FLAPS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION:**

● **If FLAPS jammed at 0**

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

- Note:
- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
  - In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED

Slats	Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
S = 0	NO LIMITATION	230 kt	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1						177 kt
S = 1						
1 < S ≤ 3	200 kt		200 kt	185 kt	177 kt	
S > 3	177 kt		177 kt	177 kt		

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

		30 MAR 12

Intentionally left blank

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.03</b>
		30 MAR 12
<b>SIDESTICK/RUDDER PEDALS STIFF</b>		
<p>Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:</p> <ul style="list-style-type: none"><li>- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or</li><li>- One sidestick and the rudder pedals at the same time.</li></ul> <p>The piloting technique remains the same: The aircraft remains responsive. However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.</p> <p>AP DISENGAGEMENT.....CONFIRM</p> <p>CONSIDER TRANSFERRING CONTROL TO PNF</p> <p>● <b>FOR DECRAB, ROLLOUT, OR ENGINE FAILURE</b></p> <p>BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL</p>		

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

STABILIZER JAM

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
 The flight control normal law remains active in this case and there is no ECAM warning.

AP..... OFF  
 MAN PITCH TRIM.....CHECK

*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

● **IF MAN TRIM AVAIL:**

TRIM FOR NEUTRAL ELEV

*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

**APPR PROC**

● **IF MAN TRIM NOT AVAIL:**

FOR LDG.....USE FLAP 3  
*Do not select configuration full so as not to degrade the handling qualities.*

GPWS LDG FLAP 3..... ON

CAT 2 INOP

**FUEL IMBALANCE**

FOB..... CHECK  
 Compare the FOB + FU, with the FOB at departure.  
 If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. Refer to ABN-28 FUEL LEAK.
----------------	------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON  
 ● On the lighter side and in the center tank:  
   FUEL PUMPS.....OFF  
 ● When fuel is balanced:  
   FUEL PUMPS (WING + CTR)..... ON  
   FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>28.02A</b>
		30 MAR 12

**FUEL LEAK (Cont'd)**

ENGINE RESTART..... CONSIDER

<b>CAUTION</b>	Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.
----------------	----------------------------------------------------------------------------------------------------------------------

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

- **If fuel smell in the cabin:**  
 APU (if ON)..... OFF  
*This prevents additional fuel loss through the APU feeding line.*
- **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**  
 CTR TK PUMP 1+2..... ON

**FOR LANDING**

<b>CAUTION</b>	Do not use reversers.
----------------	-----------------------

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or INVALID DATA message),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, ECAM DUs or MCDU 1 is(are) affected.

GEN 1 ..... OFF

#### ■ If DUs do not stop flashing:

GEN 1 ..... ON

#### ■ If DUs stop flashing:

GEN 1 ..... KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM ..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR ..... AS RQRD

APU START ..... CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2 ..... OFF

#### ■ If DUs do not stop flashing:

GEN 2 ..... ON

#### ■ If DUs stop flashing:

GEN 2 ..... KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM ..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR ..... AS RQRD

APU START ..... CONSIDER

### ■ DU is blank (with or without a large letter “F” in amber), or the display is distorted:

DU (affected) ..... AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected) ..... USE

*Transfer SD to the F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected) ..... USE

### ■ INVALID DISPLAY UNIT message is displayed:

This may be caused by a DU failure.

FOR AUTOMATIC DU RECOVERY ..... WAIT MORE THAN 40 s

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>31.01A</b> 30 MAR 12
<b>DISPLAY UNIT FAILURE (Cont'd)</b>		
<ul style="list-style-type: none"> <li>● <b>IF DU IS AUTOMATICALLY RECOVERED:</b> No crew action is required.</li> <li>● <b>IF DU IS NOT RECOVERED:</b> Non-recovered DU..... AS RQRD <i>The DU can be switched off.</i></li> <li>■ <b>INVALID DATA message appears (not on all DUs):</b> EIS DMC SWITCHING..... AS RQRD</li> <li>● <b>If unsuccessful:</b> DU (affected)..... OFF THEN ON  <i><u>Note:</u> The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.</i></li> <li>■ <b>INVALID DATA message appears on all DUs:</b> The autopilot, autothrust and MCDU navigation data are still available, and may be used. FOR AUTOMATIC DUs RECOVERY ..... WAIT MORE THAN 40 s</li> <li>● <b>IF ALL DUs ARE AUTOMATICALLY RECOVERED:</b> No crew action is required.</li> <li>● <b>IF ONE OR MORE DUs ARE NOT RECOVERED:</b> Non-recovered DUs..... OFF FOR 40 s Non-recovered DUs..... BACK ON sequentially           <ul style="list-style-type: none"> <li>● <b>If the initial failure re-occurs (INVALID DATA message appears on all DUs), when switching a given DU back ON:</b> Apply the entire procedure again, from the beginning. Leave this specific DU permanently OFF.</li> </ul> </li> <li>■ <b>INVERSION OF THE EWD AND THE SD:</b> ECAM UPPER DISPLAY ..... OFF THEN ON <i>The same action on the EIS DMC SWITCHING selector produces the same effect.</i></li> </ul>		

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

MULTIPLE UNDUE ECAM ALERTS

- In the case of multiple undue ECAM alerts concerning :
- ENG 1(2) N1(N2) (EGT) (FF) OVER LIMIT or
  - ENG 1(2) N1(N2) (EGT) (EPR) (FF) DISCREPANCY or,
  - NAV ATT(ALT) (HDG) DISCREPANCY or,
  - NAV FM/GPS POS DISAGREE or,
  - FUEL F.USED/FOB DISAGREE or,
  - MINIMUM or HUNDRED ABOVE callouts,

possibly associated with EFIS red flags, apply the below procedure :

AFFECTED PARAMETERS..... CROSSCHECK

*Crosscheck the affected parameters on the E/WD, PFD, ND or on the related SD page to confirm that the alerts are spurious.*

- **If it is confirmed that the ECAM alerts are spurious, identify the faulty DMC :**  
EIS DMC SWITCH.....CAPT 3  
*DMC 3 replaces DMC 1. If the undue alerts stop, DMC 1 is the faulty DMC.*
- **If unsuccessful :**  
EIS DMC SWITCH.....F/O 3  
*DMC 3 replaces DMC 2. If the undue alerts stop, DMC 2 is the faulty DMC.*

LOSS OF BRAKING

- IF NO BRAKING AVAILABLE:  
REV ..... MAX  
BRAKE PEDALS..... RELEASE  
A/SKID & N/W STRG..... OFF  
BRAKE PEDALS..... PRESS  
MAX BRK PR..... 1000 PSI
- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <u>WHEEL</u> SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <u>L/G</u> GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### PREPARATION

CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF

*Consider fuel reduction to a safe minimum.*

● **If NOSE L/G abnormal:**

CG location (if possible).....AFT  
 - 10 passengers from front to rear moves the CG roughly 4 % aft.  
 - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.

● **If one MAIN L/G abnormal:**

FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*

OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE  
 - Loose equipment secured.  
 - Survival equipment prepared.  
 - Belts and shoulder harness locked.

### APPROACH

GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI

● **If one or both MAIN L/G abnormal:**

GROUND SPOILERS.....DO NOT ARM

### BEFORE LANDING

RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER

● **If the external light condition is poor at landing:**

DOME LT.....DIM

### FLARE, TOUCH DOWN AND ROLL OUT

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.  
 Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

- **If NOSE L/G abnormal:**  
 NOSE..... MAINTAIN UP  
*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*  
 BRAKES (compatible with elevator efficiency)..... APPLY  
 ENG MASTERS..... OFF  
*Shutdown the engines before nose impact.*

- **If one MAIN L/G abnormal:**  
 ENG MASTERS..... OFF  
*At touchdown, shut down both engines.*  
 FAILURE SIDE WING..... MAINTAIN UP  
*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*  
 DIRECTIONAL CONTROL..... MAINTAIN  
*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

- **If both MAIN L/G abnormal:**  
 ENG MASTERS..... OFF  
*Shut down the engines in the flare, before touchdown.*  
 PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

**WHEN A/C STOPPED**

ENG (all) and APU FIRE pushbutton..... PUSH  
*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*  
 ENG (all) and APU AGENT..... DISCH

- **If Evacuation required:**  
 EVACUATION..... INITIATE  
 - All emergency and passenger doors may be used to evacuate the aircraft.  
 - Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

- **If Evacuation not required:**  
 CABIN CREW and PASSENGERS (PA)..... NOTIFY  
*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

## ADR 1 + 2 + 3 FAULT

The ECAM does not display this procedure. In the case of a triple ADR failure, the ECAM only displays dual ADR warnings.

ADR P/B (all)..... OFF  
STBY INST..... USE

Note: Disregard ECAM actions for AIR DATA SWTG and ATC since these have no effect in the case of a total loss of ADRs.

### ASSOCIATED PROCEDURES

#### **F/CTL ALTN LAW**

#### **(PROT LOST)**

MAX SPEED..... 320/0.82

See the following table for the IAS/M relationship for 0.82

## NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 °,
- 0.9 min for latitudes at or above 55 ° and below 70 °,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

The following procedure is not displayed on the ECAM:

- **If the message occurs during ILS/LOC approach (LOC green):**  
DISREGARD it.

- **If the message occurs in climb, cruise, or descent:**  
CHECK navigation accuracy, using raw data.

- **If the check is positive:**  
NAV mode and ND ARC/ROSE NAV may be used.
- **If the check is negative:**  
HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

- **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**  
Use the associated FD/AP.
- **If not:**  
Deselect GPS and revert to basic information.
- **If the message occurs during a Non Precision Approach (NPA):**
  - **Overlay approach:**  
SELECT HDG, or TRK, and use raw data.
  - **GPS or RNAV approach:**  
GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.  
During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
*ALIGN light on during 30 s.*  
*ATT MODE displayed on CDU.*
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

■ **MCDU INITIALIZATION:**

- DATA (MCDU KEY)..... PRESS  
*The DATA INDEX page is displayed.*
- IRS MONITOR (2L KEY).....PRESS  
*The IRS MONITOR page is displayed.*
- A/C HEADING..... ENTER  
*The flight crew must enter the heading in the SET HDG field (5R KEY).*

■ **CDU INITIALIZATION:**

- Depending on the CDU keyboard installed, an “H” may be written on the “5” key:
- **If “H” is written on the “5” key:**
- H KEY.....PRESS  
*Degree marker, 0 decimal point, ENT and CLR lights come on.*
- A/C HEADING..... ENTER
- **If “H” is not written on the “5” key:**
- A/C HEADING..... ENTER  
*Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.*  
*Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.*  
*Heading will be displayed on the associated ND.*  
*“HDG–ATT MODE” will be displayed on CDU.*

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and VMAX.*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s).....OFF  
 REMAINING AIR DATA.....CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR.....KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs.....OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF.....USE FLAP 3

APP SPD.....VLS +10

LDG DIST PROC.....APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST.....CLB

FLAPS.....RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

### ■ Other cases:

Refer to *ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 50	250 kt	10.0/CLB	10.5/CLB	11.5/CLB
FL 50 - FL 100		9.0/CLB	9.5/CLB	10.0/CLB

## AIR DUAL BLEED FAULT

### ■ If ENG1 BLEED was lost due to a:

LEAK on side 1

ENG 1 FIRE

Start Air Valve 1 failed open.

DESCENT TO FL100/MEA..... INITIATE

*Descend rapidly to FL 100/MEA, to prevent excessive cabin altitude.*

AVOID ICING CONDITIONS

#### ● IF ICE ACCRETION

APPR SPD..... VLS + 10 KT

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ If ENG 2 BLEED was lost due to a:

LEAK on side 2

ENG 2 FIRE

Start Air Valve 2 failed open.

X BLEED..... CHECK CLOSED

DESCENT TO FL200/MEA..... INITIATE

*Descend rapidly to FL 200, to recover the bleed supply from the APU.*

APU..... START

*Start the APU during the descent.*

#### ● AT, OR BELOW, FL200 :

WING A.ICE..... OFF

*APU BLEED must not be used for wing anti-ice.*

APU BLEED..... ON

MAX FL200

AVOID ICING CONDITIONS

#### ● IF ICE ACCRETION

APPR SPD..... VLS + 10 KT

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ In all other cases :

DESCENT..... INITIATE

*Descend rapidly to FL 200, so that the bleed supply may be supplied by the APU, if the bleed system recovery is not successful.*

#### ● If both packs are available :

If both packs are operative, it can be suspected that the second bleed system failed due to excessive demand. Recovery of the second failed engine bleed may be attempted.

##### ■ If ENG 1 BLEED is lost first :

PACK 1..... OFF

ENGINE 2 BLEED..... ON

##### ■ If ENG 2 BLEED is lost first :

PACK 2..... OFF

ENGINE 1 BLEED..... ON

AIR DUAL BLEED FAULT (Cont'd)

- If engine bleed recovery was not successful, or if one pack is inoperative :  
 X BLEED..... CHECK OPEN  
 DESCENT TO FL200/MEA.....CONTINUE  
*Descend rapidly to FL 200, to recover the bleed supply from the APU*  
 APU.....START  
*Start the APU during the descent.*
- AT, OR BELOW, FL200 :  
 WING A.ICE..... OFF  
*APU BLEED must not be used for wing anti-ice.*

## ENG DUAL FAILURE - FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :

**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
 THR LEVERS..... IDLE  
 FAC 1.....OFF THEN ON  
 ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.

OPTIMUM RELIGHT SPD.....280 KT

*Note: In the case of an "ENG DUAL FAILURE" during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.*

*In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:*

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

*At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).*

LANDING STRATEGY.....DETERMINE

*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*

VHF1/HF1  /ATC1.....USE

ATC.....NOTIFY

● **IF NO RELIGHT AFTER 30 SEC:**

ENG MASTERS.....OFF 30 S/ON

*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*

● **IF UNSUCCESSFUL:**

CREW OXY MASKS (Above FL 100).....ON

● **WHEN BELOW FL 250**

APU (IF AVAIL).....START

● **WHEN BELOW FL 200**

WING ANTI ICE.....OFF

APU BLEED.....ON

ENG MASTERS (one at a time).....OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
COMMERCIAL.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
*Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).*  
GND SPLR..... ARM  
MAX BRK PR..... 1000 PSI

### AT 2 000 FT AGL

## **ENG 1(2) SHUT DOWN**

■ **Normal :**

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION	External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :
---------	---------------------------------------------------------------------------------------------------------------------------------------------

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

- When burning has stopped :  
MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1  $\geq$  5 units, N2  $\geq$  5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

- Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

- Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0

50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE
<i>Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.</i>	
NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN
<i>Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.</i>	
DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

BOMB ON BOARD (Cont'd)

- **When at CAB ALT+ 2 500 ft:**  
1 PSI DELTA P..... MAINTAIN  
GALLEY..... OFF
  - **When the bomb is secured at the LRBL or cannot be moved:**  
EMER EXIT LT..... ON  
COMMERCIAL..... OFF  
  
FLAPS (fuel permitting)..... AT LEAST CONF 1  
*For landing, use normal configuration.*  
LANDING GEAR (fuel permitting, except for flight over water)..... DOWN
- **For any other steps of descent:**  
1 PSI DELTA P..... MAINTAIN
- **During approach:**  
CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**  
EVACUATION..... INITIATE  
*Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**  
CABIN CREW and PASSENGERS (PA)..... NOTIFY

CABIN PROCEDURES

If a suspect device is found in the cabin:

WARNING	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
WARNING	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
CAUTION	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

EOD PERSONNEL ON BOARD..... CHECK  
*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

BOMB..... DO NOT OPEN  
BOMB..... DO NOT CUT WIRES  
BOMB..... SECURE AGAINST SLIPPING  
BOMB..... AVOID SHOCKS  
*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

PASSENGERS..... LEAD AWAY FROM BOMB  
*Move passengers at least 4 seat rows away the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*  
*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*  
*Seat backs and tray tables must be in their full upright position.*  
*Service items may need to be collected in order to secure tray tables.*

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.02B</b>  30 MAR 12
------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	--------------------------------

<b>BOMB ON BOARD (Cont'd)</b>	
-------------------------------	--

**PORTABLE ELECTRONIC DEVICES..... SWITCH OFF**  
*The cabin crews must command passengers to switch off all portable electronic devices.*

**BOMB.....CHECK NO ANTI-LIFT DEVICE**  
*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*  
*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*  
*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*  
*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

**EMERGENCY EQUIPMENTS.....REMOVE AND STOW**  
*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

**GALLEY/IFE POWER.....OFF**  
*All galley and IFE equipments located close to the LRBL must be switched off.*

● **If the bomb can be moved:**

**RH AFT CABIN DOOR SLIDE..... DISARM**  
**LEAST RISK BOMB LOCATION (LRBL)..... PREPARE**  
*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*  
*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*  
*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

<b>CAUTION</b>	<b>DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.</b>
----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

**BOMB INDICATION LINE..... POSITION**  
*Note: A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m ) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*  
*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

**BOMB..... MOVE TO LRBL**  
*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

<b>CAUTION</b>	<i>Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.</i>
----------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## BOMB ON BOARD (Cont'd)

LEAST RISK BOMB LOCATION (LRBL).....COMPLETE

*Place an additional single thin sheet of plastic over the bomb.*

<b>CAUTION</b>	<b>DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.</b>
----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

Build up at 25 cm (10 in ) of wetted material around the sides and on top of the bomb.

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

### LRBL STACK

PASSENGERS.....MOVE/ADVISE

*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

CABIN CREW..... NOTIFY COCKPIT CREW

*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

*The flight crew must inform the cabin of emergency descent on the PA system.*

SIGNS.....ON

*The recommendation is to descend with the AP engaged :*

- Turn the ALT selector knob and pull
- Turn the HDG selector knob and pull
- Adjust the target SPD/MACH.

THR LEVERS(if A/THR not engaged)..... IDLE

- If autothrust is engaged, check that THR IDLE is displayed on the FMA.
- If not engaged, retard the thrust levers.

SPD BRK..... FULL

*Extension of the speedbrakes will significantly increase Vls.*

*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

### WHEN DESCENT ESTABLISHED

EMER DESCENT FL100, or minimum allowable altitude.

SPEED.....MAX/APPROPRIATE

**CAUTION**    *Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.*

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*

Note:    *The recommendation is to descend with the autopilot engaged.  
 Use of the autopilot is also permitted in EXPEDITE mode .*

ENG MODE SEL.....IGN  
 ATC.....NOTIFY

*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*

ATC XPDR 7700.....CONSIDER

*Squawk 7700 unless otherwise specified by ATC.*

*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*

MAX FL..... 100/MEA

#### ● IF CAB ALT > 14 000 ft:

PAX OXY MASKS..... MAN ON

*This action confirms that the passenger oxygen masks are released.*

Note:    *Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

Use the ECAM flap setting, if required for abnormal operations. In all other cases :

- FULL is preferred for optimized landing performance
- If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.

In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.

Note: For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.

● In the final approach stages

TARGET SPEED..... VLS

Reduce the selected speed on the FCU to reach VLS at runway threshold.

Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).

● At main landing gear touchdown

REVERSE THRUST..... USE MAX AVAILABLE

● After nosewheel touchdown

BRAKES.....APPLY AS NECESSARY

Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.

● Landing complete

BRAKE FANS  ..... ON

Be prepared for tire deflation, if temperatures exceed 800 °C.

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
<10	83	81	78	74	71	66	62	58
15	83	81	78	74	71	66	62	58
20	83	81	78	74	71	66	61	56
25	83	81	78	74	70	64	59	
30	83	81	78	73	67			
35	83	81	76	70	65			
40	83	80	73	67				
45	82	76	70					
50	79	73						
55								

# STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

**NOSE DOWN PITCH CONTROL..... APPLY**  
*This will reduce angle of attack*

*Note: In case of lack of pitch down authority, reducing thrust may be necessary.*

**BANK..... WINGS LEVEL**

● **When out of stall (no longer stall indications) :**

**THRUST..... INCREASE SMOOTHLY AS NEEDED**

*Note: In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.*

**SPEEDBRAKES..... CHECK RETRACTED**  
**FLIGHT PATH..... RECOVER SMOOTHLY**

● **If in clean configuration and below 20 000 ft:**

**FLAP 1..... SELECT**

*Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.*

# STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

**THRUST..... TOGA**

At the same time:

**PITCH ATTITUDE..... 15 °**  
**BANK..... WINGS LEVEL**

*Note: When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.*

TAILSTRIKE

In the event of a tailstrike, apply the following procedure:

LAND ASAP

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.  
Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

VOLCANIC ASH ENCOUNTER

- If the aircraft enters a volcanic ash cloud:
 

180 ° TURN.....	INITIATE
ATC.....	NOTIFY
A/THR.....	OFF
THRUST (conditions permitting).....	REDUCE
CREW OXYGEN MASKS.....	ON/100 %/EMER
CABIN CREW.....	NOTIFY
PASSENGER OXYGEN.....	AS RQRD
ENG ANTI ICE.....	ON
WING ANTI ICE.....	ON
PACK FLOW.....	HI

Note:     If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.

- |                           |         |
|---------------------------|---------|
| APU.....                  | START   |
| ENGINE PARAMETERS.....    | MONITOR |
| AIRSPEED INDICATIONS..... | MONITOR |

If airspeed is unreliable or lost,Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.

Note:     If all engines flame out and speed indications are lost,Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed.  
In case of engine failure, switch off the wing anti ice before engine restart.

Note:     If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization.  
To manually depressurize the cabin:

- |                         |         |
|-------------------------|---------|
| CAB PRESS MODE SEL..... | MAN     |
| MAN V/S CTL.....        | FULL UP |

Due to the increased noise level, pay particular attention to visual warnings.

## WINDSHEAR AHEAD

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear.

**Note:** When a predictive windshear alert ("WINDSHEAR AHEAD" or "GO AROUND WINDSHEAR AHEAD") is triggered, if the flight crew makes a positive verification that no hazard exists, then the alert may be disregarded, as long as:

- There are no other signs of possible windshear conditions, and
- The reactive windshear system is operational.

*Known cases of spurious predictive windshear alerts have been reported at some airports, during either takeoff or landing, due to the specific obstacle environment. However, always rely on any reactive windshear ("WINDSHEAR").*

### W/S AHEAD RED

#### ■ Takeoff

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

##### ● Before takeoff

Delay takeoff, or select the most favorable runway.

##### ● During the takeoff run

Reject takeoff.

**Note:** Predictive windshear alerts are inhibited above 100 kts until 50 ft.

##### ● When airborne

THR LEVERS.....TOGA

*As usual, the slat/flap configuration can be changed, provided the windshear is not entered.*

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if required.*

- Note:**
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD is not available, use a pitch initial attitude up to 17.5 °. If necessary to minimize the loss of height, increase this pitch attitude.

#### ■ Landing

Associated with an aural synthetic voice "GO AROUND, WINDSHEAR AHEAD".

GO AROUND.....PERFORM

*This includes the use of full backstick, if required.*

- Note:**
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD is not available, use a pitch initial attitude up to 17.5 °. If necessary to minimize the loss of height, increase this pitch attitude.

### W/S AHEAD AMBER

Apply precautionary measures, as indicated below:

#### ■ Before TAKEOFF

Delay takeoff until conditions improve.

Evaluate takeoff conditions :

- Using observations and experience.
- Checking weather conditions.

Select the most favorable runway (considering location of the likely windshear).

WINDSHEAR AHEAD (Cont'd)

Use the weather radar or the predictive windshear system before commencing takeoff to ensure that the flight path clears any potential problem areas.

Select TOGA thrust.

Monitor closely airspeed and airspeed trend during the takeoff run for early signs of windshear.

■ **During Approach**

Delay landing or divert to another airport until conditions are more favorable.

Evaluate condition for a safe landing by :

- Using observations and experience.
- Checking weather conditions.

Use the weather radar.

Select the most favorable runway, considering also which has the most appropriate approach aid.

Select FLAPS 3.

Use managed speed in the approach phase.

Check both FDs engaged in ILS, FPA or V/S.

Engage the autopilot, for a more accurate approach and earlier recognition of deviation from the beam, when ILS is available.

Note:    - *When it is using the GS mini-function, associated with managed speed, the system will carry extra speed in strong wind conditions.*  
               - *In case of strong or gusty crosswind greater than 20 kt, Refer to FPE-IFL VAPP Determination.*

WINDSHEAR

A red flag “WINDSHEAR” is displayed on each PFD associated with an aural synthetic voice “WINDSHEAR” repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

■ **At takeoff**

■ **If before V1**

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

■ **If after V1**

THR LEVERS.....TOGA  
 REACHING VR.....ROTATE  
 SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if demanded.*

Note:    1. *If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.*  
               2. *If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.*

## WINDSHEAR (Cont'd)

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA.....SET OR CONFIRM

AP (if engaged).....KEEP

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if demanded.*

Note:

1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.

CLOSELY MONITOR FLIGHT PATH AND SPEED.

RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.

**WINDSHIELD/WINDOW ARCING**

Affected WINDOW/WINDSHIELD ANTI ICE C/B.....PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

## WINDSHIELD/WINDOW CRACKED

DIAGNOSIS OF INNER PLY.....PERFORM

*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation

*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

MAX FL..... 230/MEA

*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain  $\Delta P$  5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note: The following procedure allows maintaining  $\Delta P$  5 PSI in manual cabin pressure mode.

CAB PRESS MODE SEL..... MAN

MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

$\Delta P = 5$ PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

CAB PRESS MODE SEL..... AUTO

Note: *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

CAB PRESS MODE SEL..... MAN

MAN V/S CTL..... FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.13</b>  30 MAR 12
----------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

<b>ECAM ADVISORY CONDITIONS</b>
---------------------------------

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
OXY	Cockpit oxygen bottle pressure < 600 PSI.	If mask is not being used, check if it is correctly stowed.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <u>ENG OIL LO PR</u> warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> In both cases, monitor other engine parameters, especially oil temperature and oil quantity.
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.  <u>Note:</u> <i>If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</i>  <i>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</i> <ol style="list-style-type: none"> <li>1. <u>Low Speed</u>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <u>High Speed</u>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

## VAPP CALCULATION

### VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

$$VAPP = VREF + \Delta VREF + APPR COR$$

=

VREF												
Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78	
VREF (KT) = VLS CONF FULL	CG < 25%	108	113	118	123	127	131	136	140	144	148	149
	CG ≥ 25%	106	111	116	121	125	129	134	138	142	146	147

+

$\Delta VREF^{(1)}$

+

APPRoach CORrection		
if $\Delta VREF \leq 10$ kt	if $10 \text{ kt} < \Delta VREF < 20$ kt	if $\Delta VREF \geq 20$ kt
APPR COR is the Highest of		
5 kt * if A/THR ON and / or in case of ice accretion**	1/3 Headwind Max = 15 kt	APPR COR = 1/3 Headwind Max = 10 kt
APPR COR + $\Delta VREF$ limited to 20 kt		APPR COR = 0 kt

\* Multiply the landing distance by an additional factor of 1.1

\*\* In CONF3, add another 5 knot speed increment and multiply the landing distance by an additional factor of 1.2 (instead of 1.1)

=

$$VAPP = VREF + \Delta VREF + APPR COR$$

TO BE INSERTED IN THE MCDU PERF APPR PAGE

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

#### EXAMPLE OF VAPP CALCULATION:

Failure : ALTN LAW  
Flight Conditions : Autothrust ON, ice accretion  
Landing Configuration : CONF 3  
Headwind : 12 kt  
Landing Weight/CG : 48 t/25 %  
VREF determined from the landing weight : 116 kt  
VREF correction due to the failure ( $\Delta VREF$ ) : 10 kt

As  $\Delta VREF$  is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- $5+5 = 10$  kt (ice accretion and landing in CONF 3)
- $1/3 \text{ Headwind} = 12 \text{ kt}/3 = 4$  kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

$VAPP = VREF + \Delta VREF + APPR CORR = 116 + 10 + 10 = 136$  kt

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.15</b>  30 MAR 12
----------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

## USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors "WITHOUT REV"** when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors "WITH REV"** when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note: *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column ("WITH REV." or "WITHOUT REV.")
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
	3	10			1.40×1.90×1.1=3.00
RESULT	3	10			

$VREF = 131\text{ kt.}$  Therefore  $VAPP = 131 + 10 + 5 = 146\text{ kt.}$

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.15A</b>
		30 MAR 12

FAILURES	Flaps Lever Position for Landing	$\Delta$ VREF	APPR COR	Additional Factor	LDG Factor
ALTN LAW	3	10	0	N/A	1.35*
FLAPS FAULT (F < 1, S $\geq$ 1)	3	25			1.95*
RESULT	3	25			1.95

VREF = 140 kt. Therefore VAPP =140+25 =165 kt

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.16</b>
		30 MAR 12

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b>
		30 MAR 12

<b>TRIPPED C/B RE-ENGAGEMENT</b>
----------------------------------

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 24pt; font-weight: bold;">80.20</div> <div style="text-align: center;">30 MAR 12</div>
----------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-----------------------------------------------------------------------------------------------------------------------------------

<b>COMPUTER RESET</b>
-----------------------

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor. The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>

## LOW VISIBILITY OPERATIONS (LVO)

### ● TAXI/LINE UP

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

### ● DESCENT PREPARATION

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

### ● APPROACH: REVERSION

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	COMPANY PROCEDURES	CP-LVO <b>2/2</b>
		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |
|------------------------------------------------|--------------------------------|
| - α Floor                                      | - Engine Failure               |
| - Autopilot OFF                                | - No 'LAND' green by 350 ft RA |
| - Downgrade below required approach capability | - Autoland warning light       |
| - Amber Caution                                | - No "Flare" by 30 ft          |

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	COMPANY PROCEDURES	CP-LVP <b>2/2</b>
		30 MAR 12

Intentionally left blank

## RNAV (GNSS) / RNAV (RNP) APPROACH

### ● APPROACH PREPARATION

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### ● APPROACH GUIDANCE

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### ● AFTER COMMENCING APPROACH: NAVIGATION ALERTS

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
 Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	<b>CP-AWO</b> <b>2/2</b> 30 MAR 12

## DE-ICING AND ANTI-ICING PROCEDURES

De-icing and Anti-icing Procedures Part A 8.2.3 & PRO-SUP-91-30	
Remote De-icing Bay (engines shutdown)	De-icing at terminal gate
<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li></ul>	
<b>After Start</b> <ul style="list-style-type: none"><li>Engine oil pressure may be unusually high after start until oil temperature stabilizes.</li><li>Keep APU ON.</li><li>Do not move flaps or trims.</li></ul>	
<b>At Remote Bay</b> <ul style="list-style-type: none"><li>Taxi-Lights - OFF</li><li>Engines - Shutdown</li><li>Shutdown Checklist - Complete</li></ul>	
<b>Procedure for Ground De-icing / Anti-icing (Refer to PRO-SUP-91-30) ..... apply</b> <ul style="list-style-type: none"><li>Note Start Time of Final Fluid application.</li><li>Add HOT.</li><li>Calculate expiry of HOT.</li></ul> <p>If only one De-icing truck used: Note first wing to receive treatment, as fluid is likely to fail on this wing first.</p>	
Re-evaluate ATIS, HOT, FOB, C-TWO+ Briefing <ul style="list-style-type: none"><li>Before start checklist.</li><li>Init B: re-enter ZFWCG/ZFW.</li><li>Check T.O PERF.</li><li>Flap Retraction Brief.</li></ul>	
Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
BEFORE TAKEOFF Checklist	

## CONTAMINATED RUNWAY OPERATIONS

● **TAKEOFF**

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

● **MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING**

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

- Damp or wet runway (less than 3 mm water depth)
- Runway covered with slush
- Runway covered with dry snow
- Runway covered with standing water with risk of hydroplaning or wet snow
- Ice runway or high risk of hydroplaning

Note:     The maximum crosswind values are given without gust.

LOW TEMPERATURE ALTIMETRY

Part A chapter 8 refers.

When temperature at the aerodrome is below the ISA value, it is the responsibility of the Commander to consider the effect of temperature on the minimum and reference altitudes. If corrections are to be made, the guidelines below shall be used.

- **CORRECTIONS TO MSA**
  
- **CORRECTIONS TO ALTITUDES BELOW MSA**

## VAPP DETERMINATION

The FMGS performs the following VAPP computation for landing in normal configuration (CONF 3 or CONF FULL).

Note: For CG < 25 %, add 2 kt to VLS CONF FULL and VLS CONF 3.

W(1000Kg)	40	44	48	52	56	60	64	68	72	76	78
VLS CONF FULL (KT)	106	111	116	121	125	129	134	138	142	146	147
VLS CONF 3 (KT)	109	114	119	124	128	133	137	142	146	150	152

1. The 5 kt increment is required when the A/THR is used, or when an autoland is performed.
2. In case of ice accretion, Vapp must not be lower than:
  - VLS + 5 kt in CONF FULL
  - VLS + 10 kt in CONF 3

In case of strong or gusty crosswind greater than 20 kt, Vapp should be at least VLS + 5 kt. The 5 kt increment above VLS may be increased up to 15 kt at the flight crew's discretion.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF 3

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		730	760	800	840	890	970	1060	1160	1250
	WET		970	1040	1110	1180	1260	1340	1420	1500	1580
	COVERED WITH	STANDING WATER	1270	1360	1440	1560	1690	1810	1940	2070	2180
		SLUSH	1230	1310	1400	1480	1570	1660	1780	1900	2000
		COMPACTED SNOW	1230	1310	1380	1460	1540	1620	1690	1770	1830
		ICE	2320	2480	2650	2810	2970	3140	3300	3470	3600
CORRECTION ON ACTUAL LANDING DISTANCE											
RUNWAY CONDITION	dry runway	wet runway	runway covered with								
			standing water	slush		compacted snow	ice				
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %		+4 %		+5 %			
per 10 kt headwind	No correction for headwind due to wind correction on approach speed										
per 10 kt tailwind	+17 %	+21 %	+24 %	+22 %		+16 %		+24 %			
forward C.G.	+2 %	+3 %	+3 %	+3 %		+3 %		+3 %			
2 reversers operative	-5 %	-12 %	-15 %	-14 %		-12 %		-27 %			
Per 5 kt speed increment (and no failure) add 8 % (all runways)											

Note:    -    THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

EXAMPLE: Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
Pressure altitude = 2 000 ft  
Approach speed = VLS + 5 kt  
Dry runway

Read from ALD table,  
ALD (0 ft, No wind, VLS, no reversers) = 890 m

Read from the Corrections table,  
Pressure altitude correction: 3 x 2 = +6 %  
Speed increment correction: +8 %

ALD (2 000 ft, No wind, VLS + 5 kt, no reversers) = 890 x 1.06 x 1.08 = 1 020 m.

LANDING DISTANCE WITHOUT AUTOBRAKE - CONF FULL

The actual landing distance is the distance to come to a complete stop from a point 50 ft above the landing surface. No margin is included in this distance.

ACTUAL LANDING DISTANCE (METERS)											
WEIGHT (1000 KG)			46	50	54	58	62	66	70	74	78
RUNWAY CONDITION	DRY		690	730	760	790	830	890	980	1070	1150

		SLUSH	1130	1210	1290	1370	1450	1530	1620	1720	1800
		COMPACTED SNOW	1140	1220	1290	1360	1430	1500	1570	1650	1700
		ICE	2030	2170	2310	2450	2600	2740	2880	3030	3150

CORRECTION ON ACTUAL LANDING DISTANCE							
RUNWAY CONDITION	dry runway	wet runway	runway covered with				
			standing water	slush	compacted snow	ice	
per 1 000 ft above SL	+3 %	+4 %	+4 %	+5 %	+4 %	+5 %	
per 10 kt headwind	No correction for headwind due to wind correction on approach speed						
per 10 kt tailwind	+18 %	+21 %	+22 %	+20 %	+17 %	+25 %	
forward C.G.	+2 %	+3 %	+3 %	+3 %	+3 %	+2 %	
2 reversers operative	-5 %	-11 %	-14 %	-13 %	-11 %	-24 %	
Per 5 kt speed increment (and no failure) add 8 % (all runways)							

*Note:*    - THE ABOVE DISTANCES ARE GIVEN FOR USE IN FLIGHT

**EXAMPLE:** Actual Landing Distance (ALD) calculation with multiple corrections

Data: LW = 62 000 kg  
 Pressure altitude = 2 000 ft  
 Approach speed = VLS + 5 kt  
 Dry runway

Read from ALD table,  
 ALD (0 ft , No wind, VLS, no reversers) = 830 m

Read from the Corrections table,  
 Pressure altitude correction: 3 × 2 = +6 %  
 Speed increment correction : +8 %

ALD (2 000 ft, No wind, VLS, no reversers) = 830 × 1.06 × 1.08 = 960 m.

AUTOLAND LANDING DISTANCE

WITH AUTOBRAKE - CONF 3

## COST INDEX FOR LONG RANGE CRUISE SPEED

### ALL ENGINES

For a quick determination of the  $CI_{LRC}$ , use:

-  $CI_{LRC} = 40$  kg/min in the FMGC.

or

-  $CI_{LRC} = 55$  (100 lb/h) in the FMGC.

## STANDARD DESCENT

## GROUND DISTANCE / AIR DISTANCE CONVERSION

**IAS / MACH CONVERSION**

## USE OF FUEL PENALTY FACTOR TABLES

### USE OF THE FUEL PENALTY FACTORS

The Fuel Penalty Factors provided in the following tables are conservative values, given as a guideline in order to increase the crew awareness and to help the decision making.

Note: *In case of failure impacting the fuel consumption, the fuel predictions provided by the FMS are no longer reliable (except in One Engine Inoperative OEL condition). The flight crew must still compute and monitor the actual fuel consumption.*

Refer to the following tables in order to assess the impact of the failure on the fuel consumption after any ECAM alert that:

- Displays the line INCREASED FUEL CONSUMP in the STATUS SD page, or
- Displays Flight Control Surfaces in the INOP SYS, or
- Impacts the Landing Gears or Landing Gear Doors retraction.

The Fuel Penalty Factors given in these tables have been calculated taking into account:

- The FUEL CRITICAL INOP SYS, and
- The aircraft configuration, speed or altitude described in the CONDITIONS column.

Ensure that all these conditions are well met before applying the corresponding Fuel Penalty Factor.

### METHODOLOGY

The methodology is the following:

- Check the **ECAM ALERT table** to determine if a Fuel Penalty Factor is applicable depending on the CONDITIONS column, then
- Check the **INOP SYS table** in order to determine if, according to the actual aircraft status, there is a Fuel Penalty Factor applicable depending on the CONDITIONS column
- If only one Fuel Penalty Factor (FPF) is applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times \text{FPF}$$
 This additional fuel must be added to the fuel predictions provided by the FMS.
- If two or more Fuel Penalty Factors (FPF) are applicable:  

$$\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (\text{FPF1} + \text{FPF2} + \dots)$$
 This additional fuel must be added to the fuel predictions provided by the FMS.

Note: *Due to previous failures in flight or dispatch under MEL, some failures could have an impact on the fuel consumption:*

- *Without being mentioned in the ECAM ALERT table (only through INOP SYS table), or*
- *If mentioned in the ECAM ALERT table, with additional INOP SYS (other than the one(s) described in the FUEL CRITICAL INOP SYS column for this specific ECAM alert) impacting also the fuel consumption.*

### Example:

- Dispatch with the ELAC 1 inoperative under MMEL
- HYD G SYS LO PR ECAM caution in flight
- These two failures lead to the loss of the left aileron
- INOP SYS will displayed "L AIL"

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is applicable (spoiler extended), sum the corresponding factor with the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

$\text{FPF (HYD G SYS LO PR)} = 10 \%$

$\text{FPF (INOP SYS: L AIL)} = 8 \%$

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times (10 \% + 8 \%)$

If the Fuel Penalty Factor of the HYD G SYS LO PR ECAM alert is not applicable (spoiler remains retracted), apply the Fuel Penalty Factor related to the INOP SYS "L(R) AIL" partially extended.

Therefore,  $\text{ADDITIONAL FUEL} = (\text{FOB} - \text{EFOD at DEST}) \times 8 \%$

	B+Y SYS LO PR	SPLR 2+3+4 R ELEV	Spoilers 2, 3 and 4 See Right elevator is failed RAT extended	3 % to 10 % See
L/G	SHOCK ABSORBER FAULT	L/G RETRACT	All landing gears are extended (Also refer to PRO-SPO-25-10)	180 %
	GEAR NOT UNLOCKED			
	BOGIE ALIGN FAULT (option)			
	GEAR UNLOCK FAULT			
	DOORS NOT CLOSED	L/G DOOR	All landing gears doors are extended	15 %

(1) During the flight, the spoiler(s) may gradually extend and increase(s) the fuel consumption.

(2) A spoiler can be suspected fully extended (runaway) if high roll rate has been experienced immediately after the failure, associated with a possible AP disconnection. A visual inspection, if time permits, can also confirm the full extension of the spoiler.

(3) The maximum value of the Fuel Penalty Factor provided in the table considers that the two pairs of corresponding spoilers gradually extend during the flight.

 <b>DRAGONAIR</b> <b>A320/A321</b> <b>QUICK REFERENCE HAND BOOK</b>	<b>IN FLIGHT PERFORMANCE</b>	<b>FPE-FPF</b> <b>3/4</b> 30 MAR 12

(4) The minimum value of the Fuel Penalty Factor provided in the table considers that all spoilers remain retracted. The maximum value has been calculated considering that all impacted spoilers gradually extend during the flight.

<b>FUEL PENALTY FACTORS/INOP SYS TABLE</b>
--------------------------------------------

SYS	INOP SYS	CONDITIONS	FUEL PENALTY FACTOR
F/CTL	L(R) AIL or L+R AIL	If one or both aileron(s) is/are indicated partially extended	8 %
	FLAPS	If Flaps are extended	80 %
	SLATS	If Slats are extended	60 %
	SLATS+FLAPS	If Slats and Flaps are extended	100 %
L/G	L/G DOOR	All landing gears doors are extended	15 %

	ND	1	2	2
	AUTO CALLOUT FUNCTION	one is required for autoland	1	1
	ATTITUDE INDICATION (STBY )	1	1	1
DH INDICATION	1 for PNF			

(1) For automatic rollout, one is required. For autoland without automatic rollout, none is required.

- Note:**
- Flight crews are not expected to check the equipment list before approach. When an ECAM or local caution occurs, the crew should use the list to confirm the landing capability.
  - On ground, the equipment list determines which approach category the aircraft will be able to perform at the next landing.
  - Electrical power supply split : This ensures that each FMGC is powered by an independent electrical source (AC and DC).
  - Failure of antiskid and/or nosewheel steering mechanical parts are not monitored for landing capability.
  - The DH will be displayed on the FMA, and the "Hundred Above" and "Minimum" auto callouts will be announced, provided that the DH value has been entered on the MCDU.

## OEB11 Issue 1.0

### "ENG 1(2) OIL FILTER CLOG"

### ECAM CAUTION DURING FLIGHT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 152.

Engine bearing N°3 failure cases, leading to in-flight shutdowns and, in some cases, accompanied by oil door/smoke in the cabin/cockpit, have been reported on V2500-A5 engines. In a recent case, where a N°3 bearing failure is highly suspected, significant smoke entered the cabin and cockpit, leading the crew to deploy the oxygen masks and divert. In most of these events, an **ENG 1(2) OIL FILTER CLOG** ECAM caution was displayed prior to the in-flight shutdown.

**Applicable to:**

All A320 family aircraft fitted V2500-A5 engines.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## "ENG 1(2) OIL FILTER CLOG" ECAM CAUTION DURING FLIGHT

### **ECAM ENTRY**

ENG 1(2) OIL FILTER CLOG

### **PROCEDURE**

Apply the following paper procedure if the ECAM triggers the ENG 1(2) OIL FILTER CLOG ECAM caution:

**ENG BLEED (affected side)..... OFF**

*Prevents possible bleed contamination by engine oil.*

**PACK (affected side)..... OFF**

*Switching OFF one pack enables the remaining pack to operate at 120 %, without any risk of misbehavior on the remaining bleed. Keep the pack on (affected side), in case of an MEL dispatch with the other pack inoperative.*

*The pack that has been switched off remains available, with the crossbleed valve open. Therefore, switch it on, in case of a subsequent independent malfunction affecting the operating pack.*

**X BLEED..... OPEN**

*Opening the crossbleed valve enables the wing anti-ice to be used, when needed.*

**CLOSELY MONITOR ENGINE PARAMETERS** for surge / stall, oil pressure variations, abnormal engine vibrations and, when necessary, apply the associated procedure.

- **If, after the oil filter clog indication, the engine experiences or has already experienced a surge/stall (audible surge detected/undetected by the ECAM) possibly accompanied by a yaw effect on the aircraft:**

**ENG (affected) THRUST LEVER..... IDLE**

*Reducing the thrust of the affected engine minimizes further damage to the engine's rotary machinery, but will not necessarily prevent more oil from entering the gas path.*

*Maintain engine at idle, and consider engine shutdown, when high vibration occurs, or oil quantity/oil pressure drops low.*

Note: *ENG 1(2) OIL FILTER CLOG ECAM caution occurring on ground during engine start are frequently due to low oil viscosity and may be self-recoverable: No maintenance action is required, if the message appears before the engine has reached a stabilized idle condition (Refer to FCOM/"ENG 1(2) OIL FILTER CLOG" procedure). Maintenance action is required, if it does not disappear when the engine is stabilized at idle.*

## OEB17 Issue 1.0

### DUAL FM RESET UPON RADIAL FIX INFO ENTRY

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 169.

Several Operators reported that both FMS reset immediately after the flight crew inserted a FIX INFO radial that intercepted the F-PLN just prior to the last point of the approach (Missed Approach Point (MAP), or runway threshold). Therefore, this OEB is issued to provide the operational recommendations that should be applied, in order to help prevent this situation.

**Applicable to:**

All A318/A319/A320/A321 aircraft with FMS2 Pegasus :

- P1C8 MOD 31896, or
- P1C9 MOD 32222, or
- P1C11 MOD 34573, or
- P1I8 MOD 31897.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	OEBPROC-17		Dual FM Reset upon Radial Fix Info Entry	00013521.0001001	30 MAR 12
	Criteria: 22-1090, P7520 Applicable to: B-HSL				

## DUAL FM RESET UPON RADIAL FIX INFO ENTRY

### ECAM ENTRY

NONE

### PROCEDURE

#### PREVENTIVE PROCEDURE

Do not use the FIX INFO function with any radials that could intercept the F-PLN just before the last point of the approach (less than 0.1 nm).

*Note: The last point of the approach corresponds to the runway threshold for an ILS approach, or to the Missed Approach Point (MAP) for a Non-Precision Approach (NPA).*

#### RECOVERY PROCEDURE

If disengaged, consider reengagement of the AP/FD and ATHR.

While the FMS is recovering, consider using RMP backup tuning for navigation.

##### ■ If the F-PLN is not lost:

Normal FMS operation can be recovered by clearing the radial FIX INFO, and then by re-entering the GW/CG.

##### ■ If the F-PLN is lost:

When the FMS has automatically recovered, perform the associated procedures (*Refer to ABN-22 LOSS OF FMS DATA IN DESCENT/APPROACH (Severe Reset)*).

No bulletin found

## NO LOCALIZER OR GLIDE SLOPE CAPTURE IN APPROACH

### ECAM ENTRY

None

### PROCEDURE

In accordance with the FCOM Standard Operating Procedures (*Refer to FCOM/PRO-NOR-SOP-18 ILS Approach Pattern*), the flight crew should closely monitor the localizer and glide slope capture, for every ILS approach.

- **If LOC\* mode does not engage when expected, the flight crew should:**

Perform the ILS interception using the LOC raw data deviations. The FD and AP can be used in selected modes (HDG-V/S modes, or preferably TRK-FPA modes) for this purpose.

Consider changing the Master FMGC:

- **If the AP is engaged:**

Change the AP in command

*(If AP1+2 are engaged, change to AP2, by pressing the AP1 pb on the FCU to disengage AP1)*

- **If the AP is disengaged, and the FDs are engaged:**

Turn off FD1

Then, attempt to reengage the LOC and G/S modes, by pressing the APPR pb.

LOC\* (G/S\*) mode should engage as expected, and the ILS can then be flown in LOC and G/S modes. However, the flight crew should disregard the approach capability on the FMA, and perform only a CAT I approach with a manual landing.

Note: *If it is still not possible to intercept the ILS after changing the Master FMGC, the flight crew must perform an ILS approach using raw data. The AP/FD can be used in selected modes (HDG/VS, or preferably TRK/FPA). The flight crew should disarm the APPR (LOC) mode(s) by setting the APPR (LOC) pb to OFF on the FCU, and then perform a CAT I approach with a manual landing.*

## OEB31 Issue 1.0

# ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 189.

This OEB is issued to provide Operators with the operational recommendations to apply in cases where the flight crew performs an RNAV or a LOC or LOC Back Course (B/C) approach with the MAP located before the runway (RWY) threshold.

This is because in such cases, the FMGC does not compute the vertical flight path correctly. As a result, it may cause the aircraft, when flown in managed vertical guidance, during an RNAV approach, to fly a vertical flight path lower than the published one on the approach procedure chart.

This anomaly also applies to the vertical deviation indication symbol, VDEV. These recommendations were originally published in *Refer to FCOM/FCOM Standard Operating Procedures - Non Precision Approach section*. Due to the fact that more and more RNAV procedures are being published in the Instrument Approach Procedures (IAP), Airbus found it necessary to publish this OEB in order to highlight these recommendations.

**Applicable to:**

All A320 family aircraft fitted with the Honeywell FMS.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

	Criteria: SA Applicable to: B-HSL				

## ERRONEOUS VERTICAL PROFILE DURING RNAV, LOC AND LOC B/C APPROACHES

### ECAM ENTRY

None

### PROCEDURE

#### FOR RNAV APPROACHES

For any approach labelled as RNV on MCDU:

VERIFY on the approach chart and on the MCDU that the MAP is at the runway threshold

On the MCDU F-PLN page, if the last waypoint of the active F-PLN, displayed in green, is identified as a runway (e.g. LFB032L), it means that the runway threshold is the MAP.

■ **If the MAP is located at the runway (RWY) threshold:**

Use of the vertical managed guidance mode (FINAL APP) is possible.

■ **If the MAP is not located at the runway (RWY) threshold:**

DO NOT USE vertical managed guidance (FINAL APP)

USE NAV mode for lateral guidance

USE SELECTED vertical guidance mode only (FPA is recommended)

DISREGARD the VDEV symbol, and crosscheck the final descent using altitude versus distance to the MAP.

Note: Approaches labelled as "GPS" on the MCDU can be flown in FINAL APP mode, regardless of the MAP position.

#### FOR LOC, OR LOC BACK COURSE (B/C) APPROACHES

CHECK the position of the MAP on the approach chart

■ **If the MAP is located at the runway (RWY) threshold:**

VDEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode.

■ **If the MAP is located before the runway (RWY) threshold:**

DISREGARD the VDEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

## **OEB36 Issue 1.0**

# **NO SRS ENGAGEMENT DURING GO AROUND IN THE CASE OF EPR MODE FAULT**

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 199.

One operator reported a case where, at takeoff, the Speed Reference System (SRS) mode did not engage, as expected while setting takeoff thrust. The aircraft was dispatched in N1 rated control mode (EPR control mode inoperative).

Investigation has shown that similar misbehavior also applies in the case of go-around with EPR control mode inoperative.

This OEB is issued to provide flight crews with an operational procedure in the case of a go-around with EPR control mode inoperative (EPR control mode failure in flight).

**Applicable to:**

All A320 family aircraft fitted with IAE engines and Flight Guidance (FG) "I9" (Thales/GE, MOD 34076) "I10" (Honeywell, MOD 35526) standard and subsequent.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## NO SRS ENGAGEMENT DURING GO AROUND IN THE CASE OF EPR MODE FAULT

### **ECAM ENTRY**

ENG 1(2) EPR MODE FAULT

### **PROCEDURE**

In the case of go-around with EPR control mode inoperative, perform a manual go-around with no FD:

Maximum landing capability is CAT 1.

Note: To perform a manual go-around with no FD, the PF simultaneously announces her/his intention, disengages the AP, applies TOGA and initiates the rotation.

GO-AROUND..... ANNOUNCE

AP (if engaged)..... OFF

BOTH FDs (if engaged)..... OFF

*Action performed by the PNF on PF request.*

THRUST LEVERS..... TOGA

ROTATION..... 15 ° OF PITCH

*Rotate to 12.5 ° in case of engine failure.*

FLAPS..... RETRACT ONE STEP

POSITIVE CLIMB..... ANNOUNCE

LDG GEAR UP..... ORDER

LDG GEAR..... SELECT UP

Adjust pitch to maintain VAPP

- **When appropriate:**

Set both FDs to ON (basic guidance modes engage)

Engage OP CLB and select appropriate speed and lateral mode

AP use as required

- **When reaching thrust reduction altitude:**

Set both thrust levers to CL detent

- **When reaching acceleration altitude:**

Resume normal acceleration and climb procedures.

Note: CLB or LVR CLB will not flash on the FMA as the A/THR is not available. The FMS does not engage the GO AROUND phase.

## OEB38 Issue 1.0

# ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the safe operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is strongly recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they are available.

**Reason for issue:**

This OEB replaces the A320 OEB 201

In follow-up to questions received from several Operators, the objective of this OEB is to remind Operators of the possible operational consequences of an erroneous Radio Altimeter (RA) height indication:

In addition this OEB is issued to:

- Highlight that during ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react to prevent the angle-of-attack from increasing.
- Provide explanation of erroneous RA height indication effects on Auto Flight System (AFS) and flight control law.

**Applicable to:**

All A318/A319/A320/A321 operators

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## ERRONEOUS RADIO ALTIMETER HEIGHT INDICATION

### ECAM ENTRY

None

### PROCEDURE

This bulletin is issued to remind operators of the possible consequences of an erroneous Radio Altimeter (RA) height indication. Erroneous RA height indication may have on aircraft systems, any of the effects listed in the OEB N°38.

This OEB PROC is issued to provide flight crews with the following recommendations:

During all phases of flight, flight crew must monitor and crosscheck all primary flight parameters and the FMA.

During ILS (or MLS, GLS) approach with AP engaged, in the event of an unexpected early THR IDLE and FLARE modes engagement, the flight crew must immediately react as follows:

- **Immediately** perform an automatic Go-Around (Thrust Levers set to TOGA),  
**OR**
- **Immediately** disconnect the AP,
  - Then continue the landing using raw data or visual references (FDs set to OFF),  
**OR**
  - Perform a manual Go-Around (Thrust Levers set to TOGA). Significant longitudinal sidestick input may be required.

Note: 1. If the flight crew does not immediately react, the angle-of-attack will increase and may reach the stall value.  
2. In case of Go-Around and if the RA is still frozen at a very low height indication:

- SRS and GA TRK modes engage
- NAV, HDG or TRK lateral modes cannot be selected
- LVR CLB will not be displayed on the FMA at THR RED ALT
- ALT\* and ALT will not engage at FCU altitude

Disconnecting AP and resetting both FDs enable to recover basic modes (HDG and V/S).

3. In CONF FULL, the auto-trim function is inhibited. Retracting one step enable to recover the auto-trim function.

For all the others events that may occur during approach, there is no change in the procedures or in the recommended flight crew reactions.

Flight crews must report in the aircraft technical logbook if any of the consequences on aircraft systems listed in the OEB N°38.

\*\*\*\*\* END OF RED OEB38 ISSUE 1.0 \*\*\*\*\*

## OEB40 Issue 1.0

### AIR ENG 1(2) BLEED ABNORMAL PR OR AIR ENG 1(2) BLEED FAULT

Approved by: Head of Flight Operations Support and Services

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 203.

Subsequent to several dual bleed loss cases reported by Operators, Airbus decided to develop different technical solutions to improve the robustness of the bleed system. These technical solutions, although significantly reducing the number of dual bleed loss occurrences, cannot fully avoid such occurrences. Therefore, this OEB is published in order to provide all SA Operators with operational procedures aiming at further reducing the number of dual bleed loss occurrences, whatever the bleed system solution installed.

**Applicable to:**

All A320 family aircraft.

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## OEB43 Issue 2.0

### F/CTL SPOILER FAULT

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:** This OEB replaces the A320 OEB 208.

- Several cases of spoiler runaway occurring in flight have been reported. During these events, the failed spoiler remained in the full deflected position for the remaining of the flight. The purpose of this OEB is to inform operators about the operational impact of such a failure and to provide the associated operational procedure.
- Following flight test , this OEB PROC is revised to modify the procedure.

**Applicable to:** All A318/A319/A320/A321 Aircrafts.  
**Cancelled by:** Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## F/CTL SPOILER FAULT

### ECAM ENTRY

F/CTL SPLR FAULT

### PROCEDURE

- If **F/CTL SPLR FAULT** is triggered

F/CTL S/D page.....CHECK

*The flight crew should check the spoiler position on the F/CTL System Display page.*

- If all amber spoilers are indicated retracted:

*Loss of one or more spoilers in the retracted position. In such a case, the flight crew must apply the following operational procedure that reflects the F/CTL SPLR FAULT ECAM caution.*

#### F/CTL SPLR FAULT

*Note: If heavy vibrations are felt, CONF3 may be used for landing in order to reduce the buffeting.*

- SPD BRK (if spoilers 3 + 4 affected).....DO NOT USE  
*Do not use speedbrakes, since using only surfaces N°2 is not efficient and would activate the SPD BRK DISAGREE caution.*

#### STATUS

- If spoilers 3+4 affected

- SPD BRK.....DO NOT USE  
LDG DIST PROC.....APPLY

INOP SYS  
SPLR(affected)  
SPD BRK (if  
spoilers 2+3+4  
affected)

- If at least one spoiler is indicated deflected in amber, apply the following procedure:

#### F/CTLSPLR FAULT

AP.....OFF

*Depending on the failed spoiler position, the AP may not have enough authority to counteract the roll induced by spoiler runaway.*

SPEED.....GDOT+10

*Whenever possible, target green dot speed +10 kt to minimize fuel consumption. However, if buffet is encountered at GDOT speed +10 kt, increase speed to fly out of buffet condition.*

CRUISE ALTITUDE.....AS REQUIRED

*Current Flight Level (FL) may not be maintained due to increased drag. Maintain a cruise FL as high as possible.*

FUEL CONSUMPTION INCREASED

FMS FUEL PRED.....DISREGARD

FUEL CONSUMPTION.....DETERMINE

F/CTL SPOILER FAULT (Cont'd)

DIVERSION..... CONSIDER

**APPR PROC**

In clean configuration, if VLS is above  $V_{FE_{NEXT}}$ , the flight crew should deselect A/THR, decelerate to  $V_{FE_{NEXT}}$ , and select CONF 1 when below  $V_{FE_{NEXT}}$ . When established at CONF 1, the flight crew can reengage the A/THR and use managed speed again.

FOR LDG.....USE FLAP 3

GPWS LDG FLAP 3..... ON

APPR SPD..... $V_{REF} + 10KT$

LDG DIST Factor without reversers.....x 1.4

LDG DIST Factors with reversers.....x 1.35

*The flight crew must apply the corresponding factor on the actual landing distance corresponding to the runway condition.*

----------------------------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------	---------------------------

## OEB44 Issue 2.0

### L/G GEAR NOT DOWNLOCKED

- This OEB covers a significant operational issue. Non-compliance with this OEB should have a significant impact on the operations of the aircraft. The Operators shall distribute its content to all flight crews without delay. An extract of this OEB is provided for insertion in the QRH.
- It is recommended that all Operators accelerate the incorporation of all corrective Service Bulletins as soon as they become available.

**Reason for issue:**

This OEB replaces the A320 OEB 209.

This OEB is issued to provide operational recommendations in the case of L/G GEAR NOT DOWNLOCKED ECAM warning.

The illustration has been revised to improve the quality and the legibility.

**Applicable to:**

All A320 family aircraft

**Cancelled by:**

Refer to the "Cancelled by" section of the associated FCOM OEB.

*Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.*

Operations Engineering Bulletins are issued by Airbus as the need arises to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.

Information in this bulletin is recommended by Airbus but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

## L/G GEAR NOT DOWNLOCKED

### ECAM ENTRY

L/G GEAR NOT DOWNLOCKED

### PROCEDURE

Apply the following procedure if the ECAM triggers the L/G GEAR NOT DOWNLOCKED warning:

#### L/G GEAR NOT DOWNLOCKED

*This warning appears, if the landing gear sequence is not completed after 30 seconds.*

L/G lever.....RECYCLE

•IF GEAR NOT DOWNLOCKED AFTER 2 MINUTES:

L/G GRAVITY EXTENSION PROC.....APPLY

STATUS

The status displayed on the ECAM is correct.

IMPORTANT

**SCOPE**

The QRH contains some specific procedures which are not displayed on the ECAM.  
As a general rule, procedures displayed on the ECAM are not provided in the QRH (Refer to FCOM PRO/ABN).

**TASK SHARING FOR ABN/EMER PROC**

The principles and guidelines described under TASK SHARING AND RESPONSIBILITIES in FCOM PRO/NOR/SOP remain applicable during emergency and abnormal procedures with the following additions:

**PF - Pilot Flying** - Responsible for:

- Thrust levers (for flight path and airspeed control)
- Flight path and airspeed control
- Aircraft configuration (request configuration change)
- Navigation
- Communications
- Monitoring of all actions associated with ECAM or paper checklists

**PM - Pilot Monitoring** - Responsible for:

- Monitoring and reading aloud the ECAM and checklists
- Performing required action or actions requested by the PF, if applicable

*Note: Under no circumstances shall the PM manipulate thrust lever, engine master switch, fire switch, IR/ADR, or any guarded switch or pushbutton without confirmation by the PF.*

**Memory Items**

When emergency/abnormal procedures are actioned from memory, the required actions are performed, as appropriate, by the PF and PM.

When all memory actions are complete and the aircraft is stabilised on the correct flight path, the:

- **PF** shall confirm that the associated actions have been completed correctly.
- **PM** shall ensure that all the required memory actions have been carried out by reference to ECAM or checklist, and then complete the remainder of the procedure.

**ECAM CLEAR**

DO NOT CLEAR ECAM WITHOUT CROSS-CONFIRMATION OF BOTH PILOTS.

**ABN/EMER PROC INITIATION**

Procedures are initiated on pilot flying command.

No action will be taken (apart from audio warning cancel through MASTER WARN light) until:

- The appropriate flight path is established and,
- The aircraft is at least 400 ft above the runway, if a failure occurs during takeoff, approach, or go around.

		30 MAR 12

## USE OF SUMMARIES

### GENERAL

In case of an electrical emergency configuration, or a dual hydraulic failure:

**The ECAM should be applied first.**

This includes both the procedure, and the STATUS section.

Only after announcing "ECAM ACTIONS COMPLETED", should the Pilot Monitoring (PM) refer to the corresponding QRH summary.

When a failure occurs, and after performing the ECAM actions, the PM must refer to the bottom of the applicable Summary page (below the Go-Around section), in order to determine the landing distance that takes into account the failure.

For dry and wet runways, the Actual Landing Distances with failure are provided in the SUMMARIES.

These Actual Landing Distances with failure are based on the following assumptions:

- The approach speed is  $VREF + \Delta VREF$ . The speed increment "APPR COR" (when applicable), and the corresponding landing distance penalty that is required when the A/THR is used, or in the case of ice accretion on surfaces that are not heated, are not taken into account.
- These distances are computed without the benefit of the reverse thrust (i.e. using the LDG DIST Factors "WITHOUT REV").

If the flight crew wants to take into account the benefit of the reverse thrust at landing, the Actual Landing Distance with failure must be computed by multiplying the two following parameters:

- The LDG DIST Factor "WITH REV" (*Refer to the LDG CONF/APPR SPD/LDG DIST Tables*), and
- The Actual Landing Distance without failure (*Refer to the Landing Distance table without Autobrake (CONF FULL)*).

For contaminated runways, the LDG DIST Factors provided in the SUMMARIES are the LDG DIST Factors "WITHOUT REV".

Depending on the actual landing distance with failure, the PM can decide whether or not a diversion is necessary.

### APPROACH PREPARATION

As always, approach preparation includes a review of the ECAM STATUS.

After reviewing the STATUS, the PM should refer to the "CRUISE" section of the summary, to determine the VREF correction, and **compute the VAPP**.

A VREF table is provided in the summary.

The LANDING and GO-AROUND sections of the summary should be used for the **approach briefing**.

### APPROACH

The APPR PROC actions should be performed by reading the APPROACH section of the summary.

**The PM should then review the ECAM STATUS**, and check that all the APPR PROC actions have been completed.

## GENERAL INFORMATION

### **EFFECTIVITY**

As QRH is published at aircraft level, each paper page has only one effectivity.

### **PAGE NUMBERING**

The page numbering follows the following rules:

- |                 |   |                                                                                                                                 |
|-----------------|---|---------------------------------------------------------------------------------------------------------------------------------|
| 00, 01, 02, ... | : | Numbering for ABN, GEN, OPS, OEB PROC sections                                                                                  |
| 01A, 03B, ...   | : | Numbering and index (A, B, ...) for procedures written on several paper pages                                                   |
| 1/10, 3/5, ...  | : | Numbering for NP-NP, FPE-SPO                                                                                                    |
| C1, C2          | : | Index of the back cover page interior                                                                                           |
| C3              | : | Index of the back cover page exterior                                                                                           |
| "BLANK"         | : | Index of an intentionally left blank paper page created to ensure the correct format of the next chapter (begins on recto page) |

### **PRELIMINARY PAGES WITHIN THE QRH BINDER**

It is essential for Airlines to correctly manage the updates of the QRH. For this purpose, Airbus publishes Preliminary Pages with each QRH revision. These Preliminary Pages are used as reference documents for Airlines to manage the QRH updates, e.g. easily insert the revisions, identify the modifications that impact the QRH, get a synthesis of changes introduced with each revision. However, when the QRH revisions have been incorporated in accordance with the information given in the Preliminary Pages, these pages do not bring operational added value and therefore are no longer useful in the QRH binder for any operational purposes. Therefore, to minimize the size of the QRH binder on board the aircraft and to optimize the operational use of the QRH, Airbus has no objection that the Airlines remove the Preliminary Pages from the QRH after the revisions have been incorporated in the QRH and all checks performed to confirm the revisions have been correctly incorporated. You will find below the list of Preliminary Pages that may be removed from the QRH binder :

- The Transmittal Letter
- The Filing Instructions
- The List of Effective Documentary Units (the LESS is the reference)
- The list of Modifications
- The Summary of Highlights
- The front pages of all QRH sections
- The Table of Contents (TOC) of the General section
- The Table of Contents (TOC) of the Operations Engineering Bulletins section (the LEOEB is the reference)
- All pages numbered "00" and "00A" of the Operations Engineering Bulletins section (approval DU of the OEBs)
- This General Information (GEN.03) section

## LOSS OF FMS DATA IN DESCENT/APPROACH (SEVERE RESET)

AP/FD lateral and vertical selected modes, and A/THR, are available immediately after the reset. If necessary, the pilot may perform the FCU selections for short-term navigation.

When the FMS has automatically recovered:

- The database cycle may have changed
- The FMGS does not autotune the ILS and ADF
- The FMS position bias is lost
- Lateral and vertical managed modes cannot re-engage
- The "CAB PR LDG ELEV FAULT" message is displayed on the ECAM
- A "MAP NOT AVAIL" message may be displayed on one ND.

Depending on the flight phase, apply the following procedure(s) as appropriate:

### ■ INITIAL APPROACH OR CLOSE TO ILS INTERCEPTION:

#### ● When the system has recovered:

Access the RAD NAV Page, and manually tune the ILS (preferably using IDENT). Enter the ILS course, if a frequency has been entered.

Fly in selected speed.

- Note:
- LOC and G/S guidance modes are available
  - VLS speed is still available and displayed on the PFD
  - Missed approach trajectory is not available.

### ■ DESCENT (IF TIME PERMITS) :

#### ● When the system has recovered:

Select the initial database

Perform DIR TO a downpath waypoint. Select heading, if required.

Perform a LAT REV at the downpath waypoint and redefine the DESTINATION in the NEW DEST field.

Redefine the arrival and/or the approach procedure.

Select the FUEL PRED Page, and enter the GW.

Activate the APPROACH phase.

Enter destination data on the PERF APPR Page, as required. Managed speed is available.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

COCKPIT DOOR FAULT

This procedure should be applied, if the Cockpit Door Locking System (CDLS) fails. This failure is indicated when the FAULT light on the center pedestal's COCKPIT DOOR panel comes on.  
In the case of a DC BUS 2 fault, no FAULT indication appears on the center pedestal's COCKPIT DOOR panel. The CDLS is not electrically-supplied, and is inoperative.

CKPT DOOR CONT panel ..... CHECK

*This panel is located on the overhead panel. It is used to identify the faulty CDLS item, and to verify the status of the pressure sensors and the three electrical latches (referred to as strikes).*

● If one or more electrical latches (strikes) are faulty:

The cockpit door is not intrusion-proof if two or more electrical latches are faulty.

The system may be recovered by performing the following steps:

Cockpit door..... OPEN

COCKPIT DOOR sw..... SET to UNLOCK

After 30 s:

COCKPIT DOOR sw..... SET to NORM

● If two pressure sensors are faulty:

Automatic latch release is not available, in case of cockpit decompression.

● If no LED on the CKPT DOOR CONT panel is on:

The CDLS control unit is faulty, therefore, the cockpit door might unlock automatically. If it does not, consider using the mechanical override system to unlock the door.

## LANDING WITH SLATS OR FLAPS JAMMED

LANDING CONF..... CONF 3

■ **Repeat the following until landing configuration is reached:**

SPEED SEL..... VFE NEXT -5 kt

*Decelerate towards VFE NEXT -5 kt but not below VLS. In case of turbulence, to avoid VFE exceedance, the pilot may decide to decelerate to a lower speed, but not below VLS.*

Note:

- The autopilot may be used down to 500 ft AGL. As it is not tuned for abnormal configurations, its behavior can be less than optimum and must be monitored.
- Approach with selected speed is recommended.
- A/THR is recommended, except in the case of a G+B SYS LO PR warning.
- OVERSPEED warning and VLS, displayed on the PFD, are computed according to the actual flaps/slats position.
- VFE and VFE NEXT are displayed on the PFD according to the FLAPS' lever position. If not displayed, use the placard speeds.
- If VLS is greater than VFE NEXT (overweight landing case), the FLAPS lever can be set in the required next position, while the speed is reduced to follow VLS reduction as surfaces extend. The VFE warning threshold should not be triggered.  
*In this case, disconnect the A/THR. A/THR can be re-engaged when the landing configuration is established.*

● **As speed reduces through VFE NEXT:**

FLAPS LEVER..... ONE STEP DOWN

■ **When landing configuration is established:**

DECELERATE TO CALCULATED APPROACH SPEED IN FINAL APPROACH

### FOR GO AROUND

The table below provides the MAX SPEEDS for the abnormal configurations.

■ **IF SLATS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION**

SELECT CLEAN CONFIGURATION

Recommended flaps retraction speed: between MAX SPEED -10 kt and MAX SPEED.

Recommended diversion speed: MAX SPEED -10 kt.

■ **IF FLAPS FAULT:**

● **FOR CIRCUIT:**

MAINTAIN SLATS/FLAPS CONFIGURATION

Recommended speed: MAX SPEED -10 kt

● **FOR DIVERSION:**

● **If FLAPS jammed at 0**

SELECT CLEAN CONFIGURATION

Note: Recommended speed for slats retraction is between MAX SPEED -10 kt and MAX SPEED of actual slat/flap position.

LANDING WITH SLATS OR FLAPS JAMMED (Cont'd)

Normal operating speeds

- If FLAPS jammed > 0

MAINTAIN SLAT/FLAP CONFIGURATION

Recommended speed for diversion: MAX SPEED -10 kt

Note:

- In some cases, MAX SPEED -10 kt may be a few knots higher than the VFE. In this situation, pilot may follow the VFE.
- In case of a go-around with CONF FULL selected, the L/G NOT DOWN warning is triggered at landing gear retraction.

MAX SPEED

Flaps	F = 0	0 < F ≤ 1	1 < F ≤ 2	2 < F ≤ 3	F > 3
Slats					
S = 0	NO LIMITATION	215 kt	200 kt	185 kt	177 kt (Not allowed)
0 < S < 1	230 kt				
S = 1					
1 < S ≤ 3	200 kt		200 kt	185 kt	177 kt
S > 3	177 kt		177 kt	177 kt	177 kt

CAUTION

For flight with SLATS or FLAPS extended, fuel consumption is increased. Refer to the fuel flow indication. As a guideline, determine the fuel consumption in clean configuration at the same altitude without airspeed limitation (e.g. From ALTERNATE FLIGHT PLANNING tables) and multiply this result by 1.6 (SLATS EXTENDED) or 1.8 (FLAPS EXTENDED) or 2 (SLATS and FLAPS EXTENDED) to obtain the fuel consumption required to reach the destination in the current configuration.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>27.02</b>

Intentionally left blank

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	ABNORMAL AND EMERGENCY PROCEDURES	27.03
		30 MAR 12
SIDESTICK/RUDDER PEDALS STIFF		
<p>Even if the autopilot is disengaged, the sidestick and/or the rudder pedals may be stiff. This may affect either:</p> <ul style="list-style-type: none"><li>- Both sidesticks (CAPT and F/O) at the same time, but not the rudder pedals, or</li><li>- One sidestick and the rudder pedals at the same time.</li></ul> <p>The piloting technique remains the same: The aircraft remains responsive.</p> <p>However, the flight crew should keep in mind that they may need to use extra force on the sidesticks and/or the rudder pedals.</p> <p>AP DISENGAGEMENT..... CONFIRM</p> <p>CONSIDER TRANSFERRING CONTROL TO PNF</p> <p>● <b>FOR DECRAB, ROLLOUT, OR ENGINE FAILURE</b></p> <p>BE PREPARED TO APPLY EXTRA FORCE ON RUDDER PEDAL</p>		

## RUDDER JAM

Rudder jamming may be detected by undue (and adverse) pedal movement during rolling maneuvers. This is because the yaw damper orders can no longer be sent to the rudder, but are fed back to the pedals. Use ECAM F/CTL SD page for a visual check of the rudder position.

### **FOR APPROACH**

**AVOID LANDING WITH CROSSWIND**

*from the side where the rudder is deflected.*

**MAX CROSSWIND for LDG 15 kt**

**AUTO BRK.....DO NOT USE**

**FOR LANDING.....USE NORMAL CONF**

**SPEED AND TRAJECTORY.....STABILIZE ASAP**

**LDG DIST PROC.....APPLY**

*Refer to QRH ABN 80 LDG CONF/ APPR SPD / LDG DIST following failures tables.*

### **ON GROUND**

**DIFFERENTIAL BRAKING.....USE ASAP**

*Do not use asymmetric reverse thrust.*

*Use nosewheel steering handle below 70 kt.*

**STABILIZER JAM**

The ELACs may not detect a stabilizer jam when the pitch trim wheel is jammed.  
 The flight control normal law remains active in this case and there is no ECAM warning.  
 AP..... OFF  
 MAN PITCH TRIM.....CHECK  
*The pitch trim wheel may not be fully jammed, the force needed may be higher than usual.*

- IF MAN TRIM AVAIL:**  
 TRIM FOR NEUTRAL ELEV  
*If manual pitch trim is available, trim to maintain the elevator at the zero position (indications on ECAM F/CTL page).*

**APPR PROC**

- IF MAN TRIM NOT AVAIL:**  
 FOR LDG.....USE FLAP 3  
*Do not select configuration full so as not to degrade the handling qualities.*  
 GPWS LDG FLAP 3..... ON  
 CAT 2 INOP

FUEL IMBALANCE

FOB..... CHECK  
*Compare the FOB + FU, with the FOB at departure.  
If the difference is significant, or if the FOB + FU decreases, suspect a fuel leak.*

<b>CAUTION</b>	A fuel imbalance may indicate a fuel leak. Do not apply this procedure, if a fuel leak is suspected. <i>Refer to ABN-28 FUEL LEAK.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------------------

FUEL X FEED..... ON

- **On the lighter side and in the center tank:**  
FUEL PUMPS.....OFF
- **When fuel is balanced:**  
FUEL PUMPS (WING + CTR)..... ON  
FUEL X FEED..... OFF

## FUEL LEAK

A fuel leak may be detected, if:

- The sum of FOB and FU significantly less than FOB at engine start or is decreasing, or
- A passenger observes fuel spray from engine/pylon or wing tip, or
- The total fuel quantity is decreasing at an abnormal rate, or
- A fuel imbalance is developing, or
- Fuel quantity in a tank is decreasing too fast (leak from engine/pylon, or hole in a tank), or
- The Fuel flow is excessive (leak from engine), or
- Fuel is smelt in the cabin.

If visibility permits, leak source may be identified by a visual check from the cabin.

### WHEN A LEAK IS CONFIRMED

LAND ASAP

#### ■ LEAK FROM ENGINE/PYLON CONFIRMED:

Engine fuel leak can be confirmed by excessive fuel flow indication, or a visual check.

THR LEVER (of affected engine)..... IDLE  
 ENG MASTER (of affected engine)..... OFF  
 FUEL X FEED..... USE AS RQRD

*If the leak stops, the crossfeed valve can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

#### ■ LEAK FROM ENGINE/PYLON NOT CONFIRMED or LEAK NOT LOCATED:

Stop any fuel transfer, and then monitor the depletion rate of each inner tank, to determine if the leak is from an engine or a wing (case 1), or from the Center tank or the APU feeding line (case 2).

FUEL X FEED..... MAINTAIN CLOSED

*The crossfeed valve must remain closed to prevent the leak from affecting both sides.*

CTR TK PUMP 1+2..... OFF

*Each engine is fed via its associated inner tank only.*

INNER TANK FUEL QUANTITIES..... MONITOR

*Monitor the depletion rate of each inner tank.*

#### ■ CASE 1: IF ONE INNER TANK DEPLETES FASTER THAN THE OTHER BY AT LEAST 300 kg (660 lb ) IN LESS THAN 30 min:

An engine leak may still be suspected. Therefore:

THR LEVER (engine on leaking side)..... IDLE  
 ENG MASTER (engine on leaking side)..... OFF  
 CTR TK PUMP 1+2..... ON  
 FUEL LEAK..... MONITOR

##### ● If leak stops:

If the inner tank fuel quantity of the affected side stops decreasing, the engine leak is confirmed and stopped.

FUEL X FEED..... USE AS RQRD

*The crossfeed valves can now be opened to re-balance fuel quantity, or to enable use of fuel from both wings. Do not restart the engine.*

##### ● If leak continues (after engine shutdown):

The inner tank fuel quantity of the affected side continues to decrease. If the leak has not stopped after engine shut down, a leak from the wing may be suspected.

## FUEL LEAK (Cont'd)

ENGINE RESTART..... CONSIDER

**CAUTION**

Do not apply the FUEL IMBALANCE procedure. Approach and landing can be done, even with one full wing/one empty wing.

■ **CASE 2: IF BOTH INNER TANKS DEplete AT A SIMILAR RATE:**

A leak from the Center tank or the APU feeding line may be suspected.

● **If fuel smell in the cabin:**

APU (if ON)..... OFF

*This prevents additional fuel loss through the APU feeding line.*

● **When fuel quantity in one inner tank is less than 3 t (6 600 lb):**

CTR TK PUMP 1+2..... ON

### FOR LANDING

**CAUTION**

Do not use reversers.

GRVTY FUEL FEEDING

ENG MODE SEL..... IGN  
AVOID NEGATIVE G FACTOR

● DETERMINE GRAVITY FEED CEILING:

Consult the following table to determine the flight altitude limitation.

Flight conditions at time of gravity feeding	Gravity feed ceiling
Flight time above FL 300 more than 30 min (Fuel deaerated)	Current FL <sup>(1)</sup>
Flight time above FL 300 less than 30 min (Fuel non-deaerated)	FL 300 <sup>(1)</sup>
Aircraft flight level never exceeded FL 300 (Fuel non-deaerated)	FL 150 <sup>(1)</sup> , or 7 000 ft above takeoff airport, whichever is higher

(1) For JET B, gravity feed ceiling is FL 100 in all cases.

DESCEND TO GRVTY FEED CEILING (if applicable).

● WHEN REACHING GRVTY FEED CEILING:

FUEL X FEED..... OFF

● IF NO FUEL LEAK AND FOR AIRCRAFT HANDLING:

If no fuel leak, and for flight with only one engine running (this engine being fed by gravity), apply the following :

FUEL X FEED..... ON  
BANK ANGLE..... 1° WING DOWN ON LIVE ENGINE SIDE  
RUDDER TRIM..... USE

● WHEN FUEL IMBALANCE REACHES 1 000 kg (2 200 lb):

BANK ANGLE..... 2° or 3° WING DOWN ON LIVE ENG SIDE

## DISPLAY UNIT FAILURE

### ■ AFFECTED DU FLASHES INTERMITTENTLY:

This phenomenon may be due to Intermittent Electrical Power Supply Interruptions. It is evidenced by one, or a combination, of the following:

- Flashing of PFD, ND, ECAM DUs (blank screen or INVALID DATA message),
- Flashing of MCDU,
- Intermittent flight control law reversion.

### ■ IF THE CAPTAIN SIDE IS AFFECTED:

Captain PFD, captain ND, ECAM DUs or MCDU 1 is(are) affected.

GEN 1 .....OFF

#### ■ If DUs do not stop flashing:

GEN 1 ..... ON

#### ■ If DUs stop flashing:

GEN 1 .....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM ..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR .....AS RQRD

APU START ..... CONSIDER

### ■ IF THE FIRST OFFICER SIDE IS AFFECTED:

First officer PFD, first officer ND, lower ECAM or MCDU 2 is(are) affected.

GEN 2 .....OFF

#### ■ If DUs do not stop flashing:

GEN 2 ..... ON

#### ■ If DUs stop flashing:

GEN 2 .....KEEP OFF

*Keep the generator OFF for the rest of the flight.*

RUD TRIM ..... CHECK/RESET

*Intermittent Electrical Power Supply Interruptions may cause offset in the rudder trim. Check the need of the rudder trim to be reset using the sideslip indication.*

AP and/or A/THR .....AS RQRD

APU START ..... CONSIDER

### ■ DU is blank (with or without a large letter “F” in amber), or the display is distorted:

DU (affected) .....AS RQRD

*The DU can be switched off.*

ECAM/ND XFR (if the ECAM DUs are affected) ..... USE

*Transfer SD to the F/O or CAPT ND.*

PFD/ND XFR (if the EFIS DUs are affected) .....USE

### ■ INVALID DISPLAY UNIT message is displayed:

This may be caused by a DU failure.

FOR AUTOMATIC DU RECOVERY .....WAIT MORE THAN 40 s

DISPLAY UNIT FAILURE (Cont'd)

- **IF DU IS AUTOMATICALLY RECOVERED:**  
 No crew action is required.
  
- **IF DU IS NOT RECOVERED:**  
 Non-recovered DU..... AS RQRD  
*The DU can be switched off.*
  
- **INVALID DATA message appears (not on all DUs):**  
 EIS DMC SWITCHING..... AS RQRD
  
- **If unsuccessful:**  
 DU (affected)..... OFF THEN ON  
  
*Note:     The ND display may disappear, if too many waypoints and associated information are displayed. Reduce the range, or deselect WPT or CSTR, and the display will automatically recover, after about 30 s.*
  
- **INVALID DATA message appears on all DUs:**  
 The autopilot, autothrust and MCDU navigation data are still available, and may be used.  
 FOR AUTOMATIC DUs RECOVERY ..... WAIT MORE THAN 40 s
  
- **IF ALL DUs ARE AUTOMATICALLY RECOVERED:**  
 No crew action is required.
  
- **IF ONE OR MORE DUs ARE NOT RECOVERED:**  
 Non-recovered DUs..... OFF FOR 40 s  
 Non-recovered DUs..... BACK ON sequentially
  - **If the initial failure re-occurs (INVALID DATA message appears on all DUs), when switching a given DU back ON:**  
 Apply the entire procedure again, from the beginning.  
 Leave this specific DU permanently OFF.
  
- **INVERSION OF THE EWD AND THE SD:**  
 ECAM UPPER DISPLAY ..... OFF THEN ON  
*The same action on the EIS DMC SWITCHING selector produces the same effect.*

## ECAM SINGLE DISPLAY

Only the EWD is available. There is no SD on the other DUs.

■ **To call a SYS page:**

PRESS AND MAINTAIN the SYS Page key on the ECP.

■ **OVERFLOW ON THE STATUS Page:**

PRESS AND MAINTAIN the STS key on the ECP

*The first page of STATUS appears.*

RELEASE IT, THEN PRESS AGAIN WITHIN 2 s

*The second page of STATUS appears.*

CONTINUE UNTIL THE OVERFLOW ARROW DISAPPEARS.

*When the STS key is released for more than 2 s, the EWD reappears.*

MULTIPLE UNDUE ECAM ALERTS

- In the case of multiple undue ECAM alerts concerning :
- ENG 1(2) N1(N2) (EGT) (FF) OVER LIMIT or
  - ENG 1(2) N1(N2) (EGT) (EPR) (FF) DISCREPANCY or,
  - NAV ATT(ALT) (HDG) DISCREPANCY or,
  - NAV FM/GPS POS DISAGREE or,
  - FUEL F.USED/FOB DISAGREE or,
  - MINIMUM or HUNDRED ABOVE callouts,

possibly associated with EFIS red flags, apply the below procedure :

AFFECTED PARAMETERS..... CROSSCHECK

Crosscheck the affected parameters on the E/WD, PFD, ND or on the related SD page to confirm that the alerts are spurious.

- **If it is confirmed that the ECAM alerts are spurious, identify the faulty DMC :**  
EIS DMC SWITCH.....CAPT 3  
*DMC 3 replaces DMC 1. If the undue alerts stop, DMC 1 is the faulty DMC.*
- **If unsuccessful :**  
EIS DMC SWITCH.....F/O 3  
*DMC 3 replaces DMC 2. If the undue alerts stop, DMC 2 is the faulty DMC.*

LOSS OF BRAKING

- IF NO BRAKING AVAILABLE:  
REV ..... MAX  
BRAKE PEDALS..... RELEASE  
A/SKID & N/W STRG..... OFF  
BRAKE PEDALS..... PRESS  
MAX BRK PR..... 1000 PSI
- IF STILL NO BRAKING:  
PARKING BRAKE..... SHORT AND SUCCESSIVE APPLICATIONS

## RESIDUAL BRAKING PROC

● **IN FLIGHT:**

**BRAKE PEDALS.....APPLY SEVERAL TIMES**

*Press the brake pedals several times. This could set to zero the residual pressure on the alternate system.*

● **IF RESIDUAL PRESSURE REMAINS:**

**A/SKID & N/W STRG selector..... KEEP ON**

■ **IF AUTOBRAKE IS AVAILABLE:**

**FOR LANDING..... AUTO/BRK MED**

*Using MED mode gives immediate priority to normal braking upon landing gear touchdown, which cancels residual alternate pressure.*

■ **IF AUTOBRAKE IS NOT AVAILABLE:**

**JUST AFTER TOUCHDOWN.....APPLY BRAKING**

*Pressing the brake pedals gives immediate priority to normal braking, which cancels residual alternate pressure.*

Beware of possible braking asymmetry after touchdown, which can be controlled by using the pedals.

Note:     *If tire damage is suspected after landing, inspection of the tires is required before taxi.*

*If the tire is deflated but not damaged, the aircraft can be taxied at low speed with the following limitations :*

- 1. If one tire is deflated on one or more gears (ie. a maximum of three tires), the speed should be limited to 7 kt when turning.*
- 2. If two tires are deflated on the same main gear (the other main gear tires not being deflated) speed should be limited to 3 kt, and the nose wheel steering angle should be limited to 30 °.*

## L/G GRAVITY EXTENSION

### CAUTION

Do not apply this procedure if at least one green triangle is displayed on each landing gear on the WHEEL SD page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible L/G GEAR NOT DOWN ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.

GRAVITY GEAR EXTN handcrank.....PULL AND TURN

*Rotate the handle clockwise 3 turns until reaching the mechanical stop, even if resistance is felt.*

L/G lever..... DOWN

GEAR DOWN indications (if available)..... CHECK

#### Note:

1. Depending on aircraft speed, the display may show the landing gear doors in the amber transit position.
2. In the event of gravity extension, caused by the failure of both LGCIUs, landing gear position indications on ECAM are lost. LDG GEAR light on LDG GEAR control panel remain available, if LGCIU 1 is electrically supplied.
3. The L/G LGCIU 2 FAULT or BRAKES SYS 1(2) FAULT warning may be spuriously triggered after a gravity extension.
4. If the three green downlock arrows are not on, it is possible that the handcrank is not at the mechanical stop. Check that the handcrank is firmly against the mechanical stop.

### CAUTION

Nosewheel steering is lost.

#### ■ If successful:

Do not reset the free-fall system: This will avoid such undesirable effects as further loss of fluid, in the event of a leak, or possible landing gear unlocking, in the event of a gear selector valve jamming in the UP position.

#### Note:

*The free-fall system may be reset in flights being used for training. If the green hydraulic system is available, resetting the free-fall system allows the landing gear doors to be closed and the nosewheel steering to operate.*

*The flight crew should not reset the free-fall system on the ground after flight.*

#### ■ If unsuccessful:

LDG WITH ABNORMAL L/G procedure..... APPLY

## LDG WITH ABNORMAL L/G

<b>CAUTION</b>	Do not apply this procedure if at least one green triangle is displayed on each landing gear on the <b>WHEEL SD</b> page. This is sufficient to confirm that the landing gear is downlocked. Disregard any possible <b>L/G GEAR NOT DOWN</b> ECAM alert at 750 ft RA and any possible GPWS "TOO LOW GEAR" aural alert.
----------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### PREPARATION

CABIN CREW.....NOTIFY  
 ATC.....NOTIFY  
 GALLEY.....OFF

*Consider fuel reduction to a safe minimum.*

● **If NOSE L/G abnormal:**

CG location (if possible).....AFT  
 - 10 passengers from front to rear moves the CG roughly 4 % aft.  
 - 10 passengers from mid to rear moves the CG roughly 2.5 % aft.

● **If one MAIN L/G abnormal:**

FUEL IMBALANCE.....CONSIDER  
*Open the fuel X-FEED valve and switch off the pumps on the side with landing gear normally extended.*

OXYGEN CREW SUPPLY.....OFF  
 SIGNS.....ON  
 CABIN and COCKPIT.....PREPARE  
 - Loose equipment secured.  
 - Survival equipment prepared.  
 - Belts and shoulder harness locked.

### APPROACH

GPWS SYS.....OFF  
 L/G lever.....CHECK DOWN  
 GRVTY GEAR EXTN handcrank.....TURN BACK TO NORMAL  
 AUTOBRAKE.....DO NOT ARM  
 EMER EXIT LT.....ON  
 CABIN REPORT.....OBTAIN  
 A/SKID & N/W STRG.....OFF  
 MAX BRAKE PR.....1000 PSI

● **If one or both MAIN L/G abnormal:**

GROUND SPOILERS.....DO NOT ARM

### BEFORE LANDING

RAM AIR.....ON  
 BRACE FOR IMPACT.....ORDER

● **If the external light condition is poor at landing:**

DOMELT.....DIM

### FLARE, TOUCH DOWN AND ROLL OUT

Engines should be shut down sufficiently early to ensure fuel is shut off before the nacelles impact, but sufficiently late to ensure adequate hydraulic supplies for the flight controls.  
 Engine pumps continue to supply adequate hydraulic pressure for 30 s after first engine shutdown.

## LDG WITH ABNORMAL L/G (Cont'd)

REVERSE..... DO NOT USE

● **If NOSE L/G abnormal:**

NOSE..... MAINTAIN UP

*After touchdown, keep the nose off the runway by use of the elevator. Then, lower the nose on to the runway before elevator control is lost.*

BRAKES (compatible with elevator efficiency)..... APPLY

ENG MASTERS..... OFF

*Shutdown the engines before nose impact.*

● **If one MAIN L/G abnormal:**

ENG MASTERS..... OFF

*At touchdown, shut down both engines.*

FAILURE SIDE WING..... MAINTAIN UP

*Use roll control, as necessary, to maintain the unsupported wing up as long as possible.*

DIRECTIONAL CONTROL..... MAINTAIN

*Use rudder and brakes (maximum 1 000 PSI) to maintain the runway axis as long as possible.*

● **If both MAIN L/G abnormal:**

ENG MASTERS..... OFF

*Shut down the engines in the flare, before touchdown.*

PITCH ATTITUDE (at touchdown)..... NOT LESS THAN 6°

### **WHEN A/C STOPPED**

ENG (all) and APU FIRE pushbutton..... PUSH

*Pressing the ENG FIRE pb shuts off the related hydraulic pressure within a short time.*

ENG (all) and APU AGENT..... DISCH

■ **If Evacuation required:**

EVACUATION..... INITIATE

- All emergency and passenger doors may be used to evacuate the aircraft.

- Announce an appropriate command such as "PASSENGER EVACUATION-EVACUATE THROUGH LH or RH DOORS" using the Passenger Address (PA) system, and press the EVAC COMMAND pushbutton .

■ **If Evacuation not required:**

CABIN CREW and PASSENGERS (PA)..... NOTIFY

*Ensure that all the landing gears are secured before initiating the disembarkation (before switching OFF the seat belts signs).*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

## ADR 1 + 2 + 3 FAULT

The ECAM does not display this procedure. In the case of a triple ADR failure, the ECAM only displays dual ADR warnings.

ADR P/B (all)..... OFF  
STBY INST..... USE

Note: Disregard ECAM actions for AIR DATA SWTG and ATC since these have no effect in the case of a total loss of ADRs.

### ASSOCIATED PROCEDURES

#### **F/CTL ALTN LAW**

#### **(PROT LOST)**

MAX SPEED..... 320/0.82

See the following table for the IAS/M relationship for 0.82

FL	390	370	350	330	310	290	280 and below
MAX SPD	252	265	278	290	305	315	320

WHEN L/G DN: DIRECT LAW

At landing gear extension, control reverts to direct law in pitch, as well as in roll.

Note: Use manual control of cabin pressurization.

MODE SEL.....MAN

MAN V/S CTL.....AS RQRD

### STATUS

MAX SPEED..... 320/0.82

RUD WITH CARE ABV 160 kt

See <sup>(1)</sup>

V/S CTL..... FULL UP

Note:     *In case of a go-around, respect maximum speed 215 kt in CONF 1+F, due to the loss of flap auto retraction to CONF 1.*

<b>CAUTION</b>	<i>Check that the outflow valve is fully open, and that cabin altitude is at airfield elevation before opening the doors.</i>
----------------	-------------------------------------------------------------------------------------------------------------------------------

<sup>(1)</sup>    *At slats' extension, full rudder travel authority is recovered.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>34.02</b>
		30 MAR 12

Intentionally left blank

NAV FM / GPS POS DISAGREE

The FMS and GPS positions differ by more than a longitude threshold that depends on the latitude:

- 0.5 min for latitudes below 55 °,
- 0.9 min for latitudes at or above 55 ° and below 70 °,
- or a latitude threshold of 0.5 min, regardless of the latitude.

A/C POS.....CHECK

- The following procedure is not displayed on the ECAM:
- **If the message occurs during ILS/LOC approach (LOC green):**  
DISREGARD it.
  - **If the message occurs in climb, cruise, or descent:**  
CHECK navigation accuracy, using raw data.
    - **If the check is positive:**  
NAV mode and ND ARC/ROSE NAV may be used.
    - **If the check is negative:**  
HDG/TRK mode and raw data must be used.

When possible, compare the FM position versus the GPIRS position, on the POSITION MONITOR page:

- **If one FM position agrees with the GPIRS position on the POSITION MONITOR page:**  
Use the associated FD/AP.
- **If not:**  
Deselect GPS and revert to basic information.
- **If the message occurs during a Non Precision Approach (NPA):**
  - **Overlay approach:**  
SELECT HDG, or TRK, and use raw data.
  - **GPS or RNAV approach:**  
GO AROUND, or fly visual, if visual conditions are met.

## EGPWS ALERTS

### CAUTION

During night or IMC conditions, apply the procedure immediately. Do not delay reaction for diagnosis.  
During daylight VMC conditions, with terrain and obstacles clearly in sight, the alert may be considered cautionary. Take positive corrective action until the alert stops or a safe trajectory is ensured.

### ● "PULL UP" – "TERRAIN TERRAIN PULL UP" – "TERRAIN AHEAD PULL UP" – "OBSTACLE AHEAD PULL UP":

Simultaneously:

AP ..... OFF

PITCH ..... PULL UP

*Pull to full backstick and maintain in that position.*

THRUST LEVERS ..... TOGA

SPEED BRAKES lever ..... CHECK RETRACTED

BANK ..... WINGS LEVEL or ADJUST

#### ● When flight path is safe and the warning stops:

Decrease pitch attitude and accelerate.

#### ● When speed is above VLS, and vertical speed is positive:

Clean up aircraft as required.

### ● "TERRAIN TERRAIN" "TOO LOW TERRAIN":

Adjust the flight path or initiate a go-around.

### ● "TERRAIN AHEAD"-"OBSTACLE AHEAD":

Adjust the flight path. Stop descent. Climb and/or turn, as necessary, based on analysis of all available instruments and information.

### ● "SINK RATE" "DON'T SINK":

Adjust pitch attitude and thrust to silence the alert.

### ● "TOO LOW GEAR" - "TOO LOW FLAPS":

Perform a go-around.

### ● "GLIDE SLOPE":

Establish the aircraft on the glideslope, or set the G/S MODE pb to OFF, if flight below the glideslope is intentional (non precision approach (NPA)).

IR ALIGNMENT IN ATT MODE

If IR alignment is lost, the navigation mode is inoperative (red ATT flag on PFD and red HDG flag on ND). Aircraft attitude and heading may be recovered by applying the following procedure.  
 Aircraft must stay level with constant speed during 30 s.

- MODE SELECTOR..... ATT  
*ALIGN light on during 30 s.*  
*ATT MODE displayed on CDU.*
- LEVEL A/C ATTITUDE..... HOLD  
 CONSTANT A/C SPEED..... MAINTAIN  
 DISPLAY SYS switch..... AFFECTED SYS  
 DISPLAY DATA switch..... HDG

■ **MCDU INITIALIZATION:**

- DATA (MCDU KEY)..... PRESS  
*The DATA INDEX page is displayed.*
- IRS MONITOR (2L KEY).....PRESS  
*The IRS MONITOR page is displayed.*
- A/C HEADING..... ENTER  
*The flight crew must enter the heading in the SET HDG field (5R KEY).*

■ **CDU INITIALIZATION:**

- Depending on the CDU keyboard installed, an “H” may be written on the “5” key:
- **If “H” is written on the “5” key:**
- H KEY.....PRESS  
*Degree marker, 0 decimal point, ENT and CLR lights come on.*
- A/C HEADING..... ENTER
- **If “H” is not written on the “5” key:**
- A/C HEADING..... ENTER  
*Enter aircraft magnetic heading on CDU keyboard. Then press ENT key to enter data.*  
*Example : to enter heading 320 °, dial 3, 2, 0, 0 then press ENT.*  
*Heading will be displayed on the associated ND.*  
*“HDG–ATT MODE” will be displayed on CDU.*

Due to IR drift, magnetic heading has to be periodically crosschecked with standby compass and updated if required.

## TCAS WARNINGS

■ **Traffic advisory: “TRAFFIC” messages:**

Do not perform a maneuver based on a TA alone.

■ **Resolution advisory : All “CLIMB” and “DESCEND” or “MAINTAIN VERTICAL SPEED MAINTAIN” or “ADJUST VERTICAL SPEED ADJUST” or “MONITOR VERTICAL SPEED” type messages**

AP (if engaged)..... OFF

BOTH FDs..... OFF

Respond promptly and smoothly to an RA by adjusting or maintaining the pitch, as required, to reach the green area and/or avoid the red area of the vertical speed scale.

*Note: Avoid excessive maneuvers while aiming to keep the vertical speed just outside the red area of the VSI, and within the green area. If necessary, use the full speed range between  $V_{\alpha max}$  and VMAX.*

Respect stall, GPWS, or windshear warning.

Notify ATC.

● **GO AROUND procedure must be performed when an RA “CLIMB” or “INCREASE CLIMB” is triggered on final approach:**

*Note: Resolution Advisories (RA) are inhibited below 900 ft.*

■ **When “CLEAR OF CONFLICT” is announced:**

Resume normal navigation in accordance with ATC clearance.

AP/FD can be re-engaged as desired.

UNRELIABLE SPEED INDICATION/ADR CHECK PROC

- If the safe conduct of the flight is impacted:

MEMORY ITEMS

AP/FD..... OFF

A/THR..... OFF

PITCH/THRUST:

Below THRUST RED ALT..... 15°/TOGA

Above THRUST RED ALT and Below FL 100..... 10°/CLB

Above THRUST RED ALT and Above FL 100..... 5°/CLB

FLAPS..... Maintain current CONFIG

SPEEDBRAKES..... Check retracted

L/G..... UP

When at, or above MSA or Circuit Altitude:

Level off for troubleshooting

GPS ALTITUDE..... Display on MCDU

- To level off for troubleshooting:

AP/FD..... OFF

A/THR..... OFF

*Note: Check the actual slat/flap configuration on ECAM, since flap auto-retraction may occur.*

PITCH/THRUST FOR INITIAL LEVEL OFF				
SLATS/FLAPS EXTENDED				
		Above 67 t	67 t-57 t	Below 57 t
CONF	Speed	Pitch (°)/Thrust (% N1)		
3	F	7.5/61.8	7.5/57.5	7.5/53.0
2	F	9.0/61.6	9.0/57.3	9.0/52.8
1 + F	S	4.5/60.2	4.5/56.1	4.5/51.2
1	S	7.5/58.0	7.5/53.9	7.5/48.9
CLEAN				
FL	Speed	Pitch (°)/Thrust (% N1)		
Below FL 200	250 kt	4.0/62.4	3.0/60.1	2.0/58.3
FL 200 -FL 320	275 kt	3.0/73.4	2.0/71.6	1.5/70.2
Above FL 320	M 0.76	2.5/79.2	2.5/78.1	2.0/77.0

FLYING TECHNIQUE TO STABILIZE SPEED :

Adjust pitch in order to fly the required flight path.  
When target pitch is reached, flying intended flight path, adjust thrust to target:  
*If the aircraft pitch tends to increase, aircraft is slow, then increase thrust;*  
*If the aircraft pitch tends to decrease, aircraft is fast, then decrease thrust.*

WHEN FLIGHT PATH IS STABILIZED

PROBE/WINDOW HEAT.....ON

TECHNICAL RECOMMENDATIONS:

- Respect Stall Warning  
To monitor speed, refer to IRS Ground Speed, or GPS Ground Speed variations
- If remaining altitude indication is unreliable:  
Do not use FPV and/or V/S, which are affected.  
ATC altitude is affected. Notify the ATC.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

Refer to GPS altitude: altitude variations may be used to control level flight, and is an altitude cue.

Refer to Radio Altimeter.

<b>CAUTION</b>	If the failure is due to radome destruction, the drag will increase and therefore N1 must be increased by 5 %. Fuel flow will increase by about 27 %.
----------------	-------------------------------------------------------------------------------------------------------------------------------------------------------

### AFFECTED ADR IDENTIFICATION:

Crosscheck all speed indications and *Refer to the Operating Speeds table of the FPE In Flight Performance QRH Section (for F, S speeds) or Refer to Severe Turbulence table of QRH Operational Data Section in clean*

■ **If at least one ADR is reliable:**

Faulty ADR(s).....OFF  
 REMAINING AIR DATA.....CONFIRM

*Alternate sources may be used to evaluate the air data:*

- GPS altitude
- GPS and IRS Ground Speeds, taking into account altitude and wind effect.

■ **If affected ADR(s) cannot be identified or all ADRs are affected:**

ONE ADR.....KEEP ON  
*Keep one ADR ON to maintain the STALL WARNING protection.*

TWO ADRs.....OFF  
*This prevents the flight control laws from using two coherent but unreliable ADR data.*

LDG CONF.....USE FLAP 3

APP SPD.....VLS +10

LDG DIST PROC.....APPLY

*Refer to the LDG CONF/APPR SPD/LDG DIST tables (QRH ABN 80)*

■ **To return to departure airport:**

Keep takeoff configuration preferably.

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Approaches (Pitch & Thrust Tables)*

■ **To accelerate and clean up after takeoff:**

Accelerate and clean up the aircraft in level flight:

THRUST.....CLB

FLAPS.....RETRACT

Retract from 3 or 2 to 1, once CLB thrust is set.

Retract from 1 to 0, when the aircraft pitch is lower than the pitch for S speed (*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Level-Off (Pitch & Thrust Table)*)

Once in clean configuration, *Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables)* for flight continuation.

## UNRELIABLE SPEED INDICATION/ADR CHECK PROC (Cont'd)

■ **Other cases:**

*Refer to ABN-34-C UNRELIABLE SPEED INDICATION/ADR CHECK PROC - Climb/Cruise/Descent (Pitch & Thrust Tables) for flight continuation.*

### CLIMB

Set the thrust to CL.

CLEAN				
		Above 67 t	67 t -57 t	Below 57 t

LDG DIST PROC..... APPLY

*Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

### ■ In all other cases :

DESCENT..... INITIATE

*Descend rapidly to FL 200, so that the bleed supply may be supplied by the APU, if the bleed system recovery is not successful.*

#### ● If both packs are available :

If both packs are operative, it can be suspected that the second bleed system failed due to excessive demand. Recovery of the second failed engine bleed may be attempted.

#### ■ If ENG 1 BLEED is lost first :

PACK 1..... OFF

ENGINE 2 BLEED..... ON

#### ■ If ENG 2 BLEED is lost first :

PACK 2..... OFF

ENGINE 1 BLEED..... ON

**AIR DUAL BLEED FAULT (Cont'd)**

- If engine bleed recovery was not successful, or if one pack is inoperative :
  - X BLEED..... CHECK OPEN
  - DESCENT TO FL200/MEA.....CONTINUE
  - Descend rapidly to FL 200, to recover the bleed supply from the APU*
  - APU.....START
  - Start the APU during the descent.*
- AT, OR BELOW, FL200 :
  - WING A.ICE..... OFF
  - APU BLEED must not be used for wing anti-ice.*
  - APU BLEED..... ON
  - MAX FL200
  - AVOID ICING CONDITIONS
- IF ICE ACCRETION
  - APPR SPD.....VLS + 10 KT
  - LDG DIST PROC..... APPLY
  - Refer to FCOM-QRH ABN 80 LDG CONF/APPR SPD/LDG DIST Tables.*

ENG DUAL FAILURE - FUEL REMAINING

Apply first the following actions required by the ECAM ENG DUAL FAILURE (if not already done) :  
**LAND ASAP**

EMER ELEC PWR (if EMER GEN not in line).....MAN ON  
THR LEVERS..... IDLE  
FAC 1.....OFF THEN ON  
ENG MODE SEL.....IGN

Then, as long as none of the engines recover, apply the following paper procedure, and if time permits, clear ECAM alerts, and check the ECAM STATUS page.  
OPTIMUM RELIGHT SPD.....280 KT

*Note:* In the case of an “ENG DUAL FAILURE” during high power operations (i.e. climb, cruise), it is mandatory to fly at or above the optimum relight speed in order to prevent engine core lock.  
In the case of a speed indication failure (volcanic ash), Pitch attitude for optimum relight speed is:

WEIGHT	Pitch (°)
At or below 50 000 kg/110 000 lb	-2.5
60 000 kg/132 000 lb	-1.5
70 000 kg/154 000 lb	-0.5

At 280 kt, the aircraft can fly up to about 2.2 nm per 1 000 ft (with no wind).  
LANDING STRATEGY.....DETERMINE  
*Determine whether a runway can be reached, or the most appropriate place for a forced landing/ditching.*  
VHF1/HF1  /ATC1.....USE  
ATC.....NOTIFY

- IF NO RELIGHT AFTER 30 SEC:  
ENG MASTERS..... OFF 30 S/ON  
*Unassisted start attempts can be repeated until successful, or until APU bleed is available.*
- IF UNSUCCESSFUL:  
CREW OXY MASKS (Above FL 100).....ON
  - WHEN BELOW FL 250  
APU (IF AVAIL)..... START
  - WHEN BELOW FL 200  
WING ANTI ICE..... OFF  
APU BLEED..... ON  
ENG MASTERS (one at a time)..... OFF 30 S/ON

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- When APU bleed is available or if engine restart is definitively considered impossible:  
OPTIMUM SPEED.....REFER TO TABLE BELOW

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
78	236	246	256
76	232	242	252
72	224	234	244
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind).  
Average rate of descent is approximately 1 600 ft/min.

CABIN AND COCKPIT.....PREPARE  
CABIN SIGNS.....ON  
COMMERCIAL.....OFF  
USE RUDDER WITH CARE

- WHEN BELOW FL 150  
RAM AIR.....ON

APPROACH PREPARATION

Note: Final descent slope, when configured (CONF 3 ; L/G DOWN) will be approximately 1.2 nm per 1 000 ft (with no wind).

BARO.....SET  
CREW MASKS/OXY SUPPLY (below FL 100).....OFF

IF FORCED LANDING ANTICIPATED

APPROACH

FOR LDG.....USE FLAP 3  
Only slats extend, and slowly.

MIN APPR SPEED.....150 KT  
VAPP.....DETERMINE

Vapp is the maximum between VREF + 25 kt/150 kt:

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

## ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

- **At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for landing (CONF 3 ; L/G DOWN):**
  - **When in CONF 3 and VAPP:**  
GRAVITY GEAR EXTN handcrank..... PULL AND TURN  
*Flight controls revert to direct law at landing gear extension. Wait for CONF 3 and VAPP before extending the landing gear to enable the aircraft to be trimmed for approach. Disregard "USE MAN PITCH TRIM" on the PFD, because the stabilizer is frozen in the position where it was at, when the windmilling was insufficient to provide hydraulic power.*
  - **When L/G downlocked**  
L/G lever..... DOWN  
APPROACH SPEED..... ADJUST  
*Adjust the speed to the above given Vapp. Nevertheless, to reach the landing field/runway, the approach speed may be adjusted up to 200 kt (max speed with slats extended).*  
GND SPLR..... ARM  
MAX BRK PR..... 1000 PSI

### AT 2 000 FT AGL

CABIN..... NOTIFY FOR LANDING

### IF DITCHING ANTICIPATED

#### APPROACH

FOR LDG..... USE FLAP 3  
*Only slats extend, and slowly.*  
MIN APPR SPEED..... 150 KT

ENG DUAL FAILURE - FUEL REMAINING (Cont'd)

VAPP..... DETERMINE  
*Vapp is the maximum between VREF + 25 kt/150 kt:*

Weight (1 000 kg)	40	44	48	52	56	60	64	68	72	76	78
Vapp	150	150	150	150	150	154	159	163	167	171	172

● At a suitable altitude (not below 3 000 ft AGL), configure the aircraft for ditching (CONF 3 ; L/G UP)  
L/G lever..... CHECK UP

AT 2 000 FT AGL  
CABIN..... NOTIFY FOR DITCHING  
DITCHING pushbutton..... ON  
*Prefer ditching parallel to the swell.  
If that causes a strong crosswind, ditch into the wind.  
In all cases, touch down with a pitch attitude of approximately 11 °.  
Minimize aircraft vertical speed.*

AT 500 FT AGL  
BRACE FOR IMPACT..... ORDER

AT TOUCHDOWN  
ENG MASTERS..... OFF  
APU MASTER SW..... OFF

AFTER DITCHING  
ATC (VHF 1).....NOTIFY  
FIRE pushbutton (ENG and APU).....PUSH  
AGENT (ENG and APU)..... DISCH  
*Engine Agent 2 is not available.*  
EVACUATION..... INITIATE  
ELT  ..... CHECK EMITTING  
*If not, switch on the transmitter.*

## ENG DUAL FAILURE - NO FUEL REMAINING

The flight crew should apply this paper procedure and then, if time permits, clear ECAM warnings and check the ECAM STATUS page.

THRUST LEVERS..... IDLE

FAC 1.....OFF THEN ON

*Resetting FAC 1 also enables rudder trim recovery, even if no indication is available.*

OPTIMUM SPEED.....220 KT/GREEN DOT

*Initially, fly 220 kt, because the PFD may not display the correct green dot speed. Then fly the green dot speed according to the following table:*

GREEN DOT SPEED WITH ALL ENGINES INOPERATIVE (KNOTS)			
Weight (1 000 kg)	At or below FL 200	FL 300	FL 400
68	216	226	236
64	208	218	228
60	200	210	220
56	192	202	212
52	184	194	204
48	176	186	196
44	168	178	188
40	160	170	180

*At green dot speed, the aircraft can fly up to approximately 2.5 nm per 1 000 ft (with no wind). Average rate of descent is approximately 1 600 ft/min .*

## ENG RELIGHT (IN FLIGHT)

- |                                       |           |
|---------------------------------------|-----------|
| MAX ALTITUDE.....                     | See below |
| ENG MASTER (affected).....            | OFF       |
| THR LEVER (affected).....             | IDLE      |
| ENG MODE SEL.....                     | IGN       |
| X BLEED .....                         | OPEN      |
| WING A. ICE (for starter assist)..... | OFF       |
| ENG MASTER (affected).....            | ON        |

Be aware that, contrary to an autostart on ground, the crew must take appropriate action in case of an abnormal start.

Engine light up should be achieved within 30 s after fuel flow increases.

- **When idle is reached:**

ENG MODE SEL.....	NORM
TCAS MODE SEL  .....	check TA/RA

Check that the selector is at TA/RA since, if the ENG SHUT DOWN procedure has been applied, the TCAS mode selector may have been set at the TA position.

Affected SYS.....	RESTORE
-------------------	---------

- **If no relight:**

ENG MASTER (affected).....	OFF
----------------------------	-----

Wait 30 s before attempting a new start (to drain the engine).

## **ENG 1(2) STALL**

■ **On the ground :**

THR LEVER (AFFECTED ENGINE)..... IDLE

ENG MASTER (AFFECTED ENGINE)..... OFF

■ **In flight :**

THR LEVER (AFFECTED ENGINE)..... IDLE

ENG PARAMETERS (AFFECTED ENGINE)..... CHECK

■ **IF ABNORMAL :**

ENG MASTER (AFFECTED ENGINE)..... OFF

———— ASSOCIATED PROCEDURES ————

## **ENG 1(2) SHUT DOWN**

■ **Normal :**

ENG A.ICE (AFFECTED ENGINE).....ON

WING A.ICE..... ON

THR LEVER (AFFECTED ENGINE).....SLOWLY ADVANCE

● **If a stall recurs :**

THR LEVER (AFFECTED ENGINE).....REDUCE

● **If a stall does not recur :**

Continue engine operation.

ENG TAILPIPE FIRE

CAUTION

External fire agents can cause severe corrosive damage and should, therefore, only be considered after having applied following procedure :

MAN START..... OFF  
ENG MASTER (affected).....OFF  
AIR BLEED PRESS..... ESTABLISH  
BEACON..... ON  
ENG MODE SEL.....CRANK  
MAN START..... ON

● When burning has stopped :

MAN START.....OFF  
ENG MODE SEL..... NORM

## HIGH ENGINE VIBRATION

### ■ High N2 vibrations during engine start on ground :

Engine start should be aborted (if vibration indications are available), when the N2 vibration level exceeds the 6.5-units advisory threshold. The subsequent start is to be initiated after the engine has completely spooled down. This procedure may be repeated a maximum of three times. Report any N2 vibration advisory condition in the logbook.

### ■ High N1 or N2 vibrations in operation :

The ECAM's VIB advisory (N1 ≥ 5 units, N2 ≥ 5 units) is mainly a guideline to induce the crew to monitor engine parameters more closely.

**VIB detection alone does not require engine shutdown.**

- Note:
1. High engine vibrations may be accompanied by cockpit and cabin smoke, and/or the smell of burning. This may be due only to compressor blade tip contact with associated abradable seals.
  2. High N1 vibrations are generally accompanied by perceivable airframe vibrations. High N2 vibrations can occur without perceivable airframe vibrations.

### ■ IF NO ICING CONDITIONS :

ENG PARAMETERS.....CHECK

*Check engine parameters and especially EGT ; crosscheck with the other engine. Report in the maintenance log.*

#### ● If rapid increase above the advisory :

THRUST LEVER (affected engine).....RETARD

*Flight conditions permitting, reduce N1 to maintain the vibration level below the advisory threshold.*

- Note: *If the VIB indication does not decrease following thrust reduction, this may indicate other engine problems. Apply the adequate procedure.*

### ■ IF ICING CONDITIONS :

An increase in engine vibrations in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

A/THR.....OFF

ENGINE ANTI-ICE.....CHECK

*If ENG ANTI-ICE is off, switch it ON at idle fan speed, one engine after the other at an approximate 30 s interval.*

THRUST LEVER (one engine at a time).....INCREASE THRUST

*Increase thrust to a setting compatible with the flight phase. The VIB level will return to normal after ice is shed, despite a slight increase during acceleration. Resume normal operation.*

- Note: *When vibrations above the advisory level have been experienced during the flight, and if possible, shut down the engine after landing, for taxiing.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>BLANK</b>
		30 MAR 12

Intentionally left blank

CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE

LANDING WEIGHT..... CHECK

- if the aircraft weight is above the maximum weight for circling in CONF 3 (given in the table below):

The aircraft cannot maintain flight level with CONF 3 and the landing gear down.

FOR LDG.....USE FLAP 3

CONF 3 is preferred, to minimize a configuration change in short final.

GPWS LDG FLAP 3..... ON

Delay gear extension.

- Note:
- If the approach is flown at less than 750 ft RA, the “L/G NOT DOWN” warning will be triggered. The pilot can cancel the aural warning by pressing the EMER CANC pb, located on the ECAM control panel.
  - A “TOO LOW GEAR” warning is to be expected, if the landing gear is not downlocked at 500 ft RA.

OAT (°C)	AIRPORT ELEVATION (feet)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000
0	70.0	69.0	68.0	67.0	65.0	64.0	62.0	57.0
5	70.0	69.0	68.0	67.0	65.0	64.0	60.0	55.0

45	59.0	57.0	55.0					
50	56.0	54.0						
55	53.0							

MAXIMUM WEIGHT FOR CIRCLING IN CONF 3 (1000 KG)

STRAIGHT-IN-APPROACH WITH  
ONE ENGINE INOPERATIVE

For performance reasons, do not extend flaps full until established on a final descent to landing.  
If a level off is expected during the final approach, perform the approach and landing in CONF 3.

## BOMB ON BOARD

**IF POSSIBLE, LAND AND EVACUATE THE AIRCRAFT IMMEDIATELY.**

*If it is not possible to land and evacuate the aircraft within 30 min, apply the following procedures :*

### COCKPIT PROCEDURES

#### **BACKGROUND**

To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb has been discovered.

To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude.

These conditions are achieved by using the manual pressure control.

#### **PROCEDURE**

The following procedure assumes that it is initiated during climb or cruise :

- First, maintain the cabin altitude.
- While maintaining the cabin altitude, descend the aircraft to the cabin altitude + 2 500 ft and maintain delta P at 1 PSI .
- During further steps of descent, maintain delta P at 1 PSI .
- For landing, reduce the differential pressure to zero, until the final approach.

If flight conditions are different, the crew should adapt the procedure, bearing in mind the above-mentioned principles (background paragraph).

AIRCRAFT (if climbing).....	LEVEL OFF
CABIN PRESS MODE SEL.....	MAN
CAB ALT.....	MAINTAIN
CABIN CREW.....	NOTIFY
ATC/COMPANY OPERATIONS.....	NOTIFY
FUEL RESERVES.....	DETERMINE
<i>Keep in mind that when flying at cabin altitude + 2 500 ft , the fuel consumption in CONF 1, with landing gear down, will be about 2.1 times that consumed in clean configuration.</i>	
NEXT SUITABLE AIRPORT.....	DETERMINE
FCU SPEED SELECTION KNOB.....	PULL AND TURN
<i>Select the most appropriate speed, taking into account the time to destination, the fuel consumption and the fact that low speed could reduce the consequences of possible structural damage, if the bomb explodes.</i>	
DESCENT TO CAB ALT +2 500 FEET or MEA or minimum obstacle clearance altitude.....	INITIATE
AVOID SHARP MANEUVERS	
CAB ALT.....	MAINTAIN

BOMB ON BOARD (Cont'd)

- **When at CAB ALT+ 2 500 ft:**  
1 PSI DELTA P..... MAINTAIN  
GALLEY..... OFF
  - **When the bomb is secured at the LRBL or cannot be moved:**  
EMER EXIT LT..... ON  
COMMERCIAL..... OFF  
  
FLAPS (fuel permitting)..... AT LEAST CONF 1  
*For landing, use normal configuration.*  
LANDING GEAR (fuel permitting, except for flight over water)..... DOWN
- **For any other steps of descent:**  
1 PSI DELTA P..... MAINTAIN
- **During approach:**  
CABIN PRESS MODE SEL..... AUTO
- **When aircraft on ground and stopped in a remote area (if possible) :**
  - **If evacuation required:**  
EVACUATION..... INITIATE  
*Avoid exits, and exiting on the same side as the bomb or near the bomb.*
  - **If evacuation not required:**  
CABIN CREW and PASSENGERS (PA)..... NOTIFY

CABIN PROCEDURES

If a suspect device is found in the cabin:

WARNING	Do not cut or disconnect any wires and do not open or attempt to gain entry to internal components of a closed or concealed suspect device. Any attempt may result in an explosion. Booby-trapped closed devices have been used on aircraft in the past.
WARNING	Alternate locations must not be used without consulting with an aviation explosives security specialist. Never take a suspect device to the flight deck.
CAUTION	The least risk bomb location for aircraft structure and systems is center of the RH aft cabin door.

EOD PERSONNEL ON BOARD..... CHECK  
*Announce : "Is there any EOD personnel on board ?". By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

BOMB..... DO NOT OPEN  
BOMB..... DO NOT CUT WIRES  
BOMB..... SECURE AGAINST SLIPPING  
BOMB..... AVOID SHOCKS  
*Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

PASSENGERS..... LEAD AWAY FROM BOMB  
*Move passengers at least 4 seat rows away the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*  
*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest.*  
*Seat backs and tray tables must be in their full upright position.*  
*Service items may need to be collected in order to secure tray tables.*

 <div>DRAGONAIR A320/A321 QUICK REFERENCE HAND BOOK</div>	<div>ABNORMAL AND EMERGENCY PROCEDURES</div>	<div>80.02B</div> <div>30 MAR 12</div>
--------------------------------------------------------------------------------------------------------------------------------------------------	--------------------------------------------------	----------------------------------------

BOMB ON BOARD (Cont'd)

PORTABLE ELECTRONIC DEVICES..... SWITCH OFF

*The cabin crews must command passengers to switch off all portable electronic devices.*

BOMB.....CHECK NO ANTI-LIFT DEVICE

*To check for an anti-lift switch or lever, slide a string or stiff card (such as the emergency information card) under the bomb, without disturbing the bomb.*

*If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.*

*If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.*

*If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e.g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.*

EMERGENCY EQUIPMENTS.....REMOVE AND STOW

*Emergency equipments (PBE, fire extinguisher, ...) located close to the LRBL must be removed and stowed in alternate location.*

GALLEY/IFE POWER.....OFF

*All galley and IFE equipments located close to the LRBL must be switched off.*

● If the bomb can be moved:

RH AFT CABIN DOOR SLIDE..... DISARM

LEAST RISK BOMB LOCATION (LRBL)..... PREPARE

*Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*

*On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.*

*Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.*

CAUTION

DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.

BOMB INDICATION LINE..... POSITION

Note:

*A bomb location indicator line is a 6 ft to 8 ft (1.8 m to 2.4 m ) line (e.g. neckties, headset cord, or belts connected together) preferably of contrasting color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

*Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.*

BOMB..... MOVE TO LRBL

*Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

CAUTION

Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.

**BOMB ON BOARD (Cont'd)**

LEAST RISK BOMB LOCATION (LRBL).....COMPLETE  
*Place an additional single thin sheet of plastic over the bomb.*

<b>CAUTION</b>	<b>DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.</b>
----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------

Build up at 25 cm (10 in ) of wetted material around the sides and on top of the bomb.

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.

Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water on any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

LRBL STACK

PASSENGERS.....MOVE/ADVISE  
*Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*

*Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.*

CABIN CREW..... NOTIFY COCKPIT CREW  
*Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	ABNORMAL AND EMERGENCY PROCEDURES	80.02D
		30 MAR 12
BOMB ON BOARD (Cont'd)		
EVACUATION/DISEMBARKATION.....EXECUTE		
<i>Evacuate through normal and emergency exits on the opposite side of the “bomb” location. Do not use the door just opposite the “bomb”.</i>		
<i>Use all available airport facilities to disembark without delay.</i>		

## DITCHING

This procedure applies when engines are running. If engines are not running, *Refer to the QRH ABN 70 ENG DUAL FAILURE (with or without fuel remaining) procedure, which has been amended to include the ditching procedure when the engines are not running.*

### **PREPARATION**

ATC/TRANSPONDER (if available)..... NOTIFY/SELECT A7700

*Notify ATC of the nature of the emergency encountered, and state intentions. Select transponder code A7700, or transmit the distress message on: (VHF) 121.5 MHz or (HF) 2 182 kHz or 8 364 kHz.*

CABIN and COCKPIT.....PREPARE

*Loose equipment secured, survival equipment prepared, belts and shoulder harness locked.*

GPWS SYS.....OFF

GPWS TERR.....OFF

SIGNS.....ON

EMER EXIT LT.....ON

CABIN CREW and PASSENGERS (PA)..... NOTIFY		

**EMER DESCENT**

**IMMEDIATE ACTION**

CREW OXY MASKS..... ON  
 EMER DESCENT.....ANNOUNCE(PA)  
*The flight crew must inform the cabin of emergency descent on the PA system.*  
 SIGNS.....ON  
*The recommendation is to descend with the AP engaged :*  
 - Turn the ALT selector knob and pull  
 - Turn the HDG selector knob and pull  
 - Adjust the target SPD/MACH.  
 THR LEVERS(if A/THR not engaged)..... IDLE  
 - If autothrust is engaged, check that THR IDLE is displayed on the FMA.  
 - If not engaged, retard the thrust levers.  
 SPD BRK..... FULL  
*Extension of the speedbrakes will significantly increase Vls.*  
*To avoid AP disconnection and automatic retraction of the speedbrakes, due to possible activation of Angle-of-Attack protection, allow the speed to increase before starting to use the speedbrakes.*

**WHEN DESCENT ESTABLISHED**

EMER DESCENT FL100, or minimum allowable altitude.  
 SPEED.....MAX/APPROPRIATE

<b>CAUTION</b>	<i>Descend at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and reduce speed as appropriate.</i>
----------------	--------------------------------------------------------------------------------------------------------------------------------------------------------

*Landing gear may be extended below 25 000 ft. In such a case, speed must be reduced to VLO/VLE.*  
*Note: The recommendation is to descend with the autopilot engaged.*  
*Use of the autopilot is also permitted in EXPEDITE mode .*  
 ENG MODE SEL.....IGN  
 ATC.....NOTIFY  
*Notify ATC of the nature of the emergency, and state intention. If not in contact with ATC, transmit a distress message on one of the following frequencies: (VHF) 121.5 MHz, or (HF) 2 182 kHz, or 8 364 kHz.*  
 ATC XPDR 7700.....CONSIDER  
*Squawk 7700 unless otherwise specified by ATC.*  
*To save oxygen, set the oxygen diluter selector to the N position. If the oxygen diluter selector remains at 100 %, the quantity of oxygen may not be sufficient for the entire emergency descent profile.*  
 MAX FL..... 100/MEA  
 ● **IF CAB ALT > 14 000 ft:**  
 PAX OXY MASKS..... MAN ON  
*This action confirms that the passenger oxygen masks are released.*  
*Note: Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary.*

OVERWEIGHT LANDING

LDG CONF..... AS REQUIRED

*Use the ECAM flap setting, if required for abnormal operations. In all other cases :*

- FULL is preferred for optimized landing performance
  - If the aircraft weight is above the maximum weight for go-around (given in the table below), use FLAP 3 for landing.
- In all cases, if landing configuration is different from FLAP FULL, use 1+F for go-around.*

Note:     *For weights greater than 70 000 kg (or 154 000 lb), S speed is greater than VFE CONF 2 (200 kt). Consequently, on the FCU, the crew must select a speed below 200 kt before setting FLAPS 2. When in FLAPS 2, the crew can use managed speed again.*

LDG DIST.....CHECK

PACK 1 and 2.....OFF or supplied by APU

*Selecting packs OFF (or supplied from APU) will increase the maximum thrust available from the engines in the event of a go-around.*

● **In the final approach stages**

TARGET SPEED..... VLS

*Reduce the selected speed on the FCU to reach VLS at runway threshold.*

*Touch down as smoothly as possible (Maximum V/S at touchdown 360 ft/min).*

● **At main landing gear touchdown**

REVERSE THRUST..... USE MAX AVAILABLE

● **After nosewheel touchdown**

BRAKES.....APPLY AS NECESSARY

*Maximum braking may be used after nose wheel touchdown. But, if landing distance permits, delay or reduce braking to fully benefit from the available runway length.*

● **Landing complete**

BRAKE FANS  ..... ON

*Be prepared for tire deflation, if temperatures exceed 800 °C.*

MAXIMUM WEIGHT FOR GO AROUND IN CONF 3 (1 000 kg)								
OAT °C	AIRPORT ELEVATION (FT)							
	0	2 000	4 000	6 000	8 000	10 000	12 000	14 000

55								

# STALL RECOVERY

As soon as any stall indication (could be aural warning, buffet...) is recognized, apply the immediate actions:

NOSE DOWN PITCH CONTROL..... APPLY  
*This will reduce angle of attack*

*Note:*     In case of lack of pitch down authority, reducing thrust may be necessary.

BANK..... WINGS LEVEL

● **When out of stall (no longer stall indications) :**

THRUST..... INCREASE SMOOTHLY AS NEEDED

*Note:*     In case of one engine inoperative, progressively compensate the thrust asymmetry with rudder.

SPEEDBRAKES..... CHECK RETRACTED

FLIGHT PATH..... RECOVER SMOOTHLY

● **If in clean configuration and below 20 000 ft:**

FLAP 1..... SELECT

*Note:*     If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

# STALL WARNING AT LIFT-OFF

Spurious stall warning may sound in NORMAL law, if an angle of attack probe is damaged. In this case, apply immediately the following actions:

THRUST..... TOGA

At the same time:

PITCH ATTITUDE..... 15 °

BANK..... WINGS LEVEL

*Note:*     When a safe flight path and speed are achieved and maintained, if stall warning continues, consider it as spurious.

TAILSTRIKE

In the event of a tailstrike, apply the following procedure:

LAND ASAP

MAX FL..... 100 or MSA  
*500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min , except for the final approach that must be performed normally.  
Notify the ATC of the aircraft's rate of climb.*

RAM AIR.....ON  
PACK 1 and 2..... OFF

VOLCANIC ASH ENCOUNTER

- **If the aircraft enters a volcanic ash cloud:**

180 ° TURN.....	INITIATE
ATC.....	NOTIFY
A/THR.....	OFF
THRUST (conditions permitting).....	REDUCE
CREW OXYGEN MASKS.....	ON/100 %/EMER
CABIN CREW.....	NOTIFY
PASSENGER OXYGEN.....	AS RQRD
ENG ANTI ICE.....	ON
WING ANTI ICE.....	ON
PACK FLOW.....	HI

*Note: If CARGO VENTILATION system is installed, it is recommended to switch off the CARGO ISOL VALVES, to prevent a cargo smoke warning being triggered.*

- |                           |         |
|---------------------------|---------|
| APU.....                  | START   |
| ENGINE PARAMETERS.....    | MONITOR |
| AIRSPEED INDICATIONS..... | MONITOR |

*If airspeed is unreliable or lost, Refer to QRH ABN 34 Unreliable Speed Indication/ADR Check Proc procedure.*

*Note: If all engines flame out and speed indications are lost, Refer to QRH ABN 70 DUAL ENGINE FAILURE procedure, to get the required pitch attitude for the optimum relight speed. In case of engine failure, switch off the wing anti ice before engine restart.*

*Note: If sufficient visibility is not granted for approach due to windshield/window damage, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

- |                         |         |
|-------------------------|---------|
| CAB PRESS MODE SEL..... | MAN     |
| MAN V/S CTL.....        | FULL UP |

*Due to the increased noise level, pay particular attention to visual warnings.*

## WINDSHEAR AHEAD

The "W/S AHEAD" message is displayed on each PFD. The color of the message depends on the severity and location of the windshear.

**Note:** When a predictive windshear alert ("WINDSHEAR AHEAD" or "GO AROUND WINDSHEAR AHEAD") is triggered, if the flight crew makes a positive verification that no hazard exists, then the alert may be disregarded, as long as:

- There are no other signs of possible windshear conditions, and
- The reactive windshear system is operational.

*Known cases of spurious predictive windshear alerts have been reported at some airports, during either takeoff or landing, due to the specific obstacle environment. However, always rely on any reactive windshear ("WINDSHEAR").*

### W/S AHEAD RED

#### ■ Takeoff

Associated with an aural synthetic voice "WINDSHEAR AHEAD, WINDSHEAR AHEAD".

##### ● Before takeoff

Delay takeoff, or select the most favorable runway.

##### ● During the takeoff run

Reject takeoff.

**Note:** Predictive windshear alerts are inhibited above 100 kts until 50 ft.

##### ● When airborne

THR LEVERS.....TOGA

*As usual, the slat/flap configuration can be changed, provided the windshear is not entered.*

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if required.*

- Note:**
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD is not available, use a pitch initial attitude up to 17.5 °. If necessary to minimize the loss of height, increase this pitch attitude.

#### ■ Landing

Associated with an aural synthetic voice "GO AROUND, WINDSHEAR AHEAD".

GO AROUND.....PERFORM

*This includes the use of full backstick, if required.*

- Note:**
1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
  2. If the FD is not available, use a pitch initial attitude up to 17.5 °. If necessary to minimize the loss of height, increase this pitch attitude.

### W/S AHEAD AMBER

Apply precautionary measures, as indicated below:

#### ■ Before TAKEOFF

Delay takeoff until conditions improve.

Evaluate takeoff conditions :

- Using observations and experience.
- Checking weather conditions.

Select the most favorable runway (considering location of the likely windshear).

## WINDSHEAR AHEAD (Cont'd)

Use the weather radar or the predictive windshear system before commencing takeoff to ensure that the flight path clears any potential problem areas.

Select TOGA thrust.

Monitor closely airspeed and airspeed trend during the takeoff run for early signs of windshear.

### ■ **During Approach**

Delay landing or divert to another airport until conditions are more favorable.

Evaluate condition for a safe landing by :

- Using observations and experience.
- Checking weather conditions.

Use the weather radar.

Select the most favorable runway, considering also which has the most appropriate approach aid.

Select FLAPS 3.

Use managed speed in the approach phase.

Check both FDs engaged in ILS, FPA or V/S.

Engage the autopilot, for a more accurate approach and earlier recognition of deviation from the beam, when ILS is available.

Note: - When it is using the GS mini-function, associated with managed speed, the system will carry extra speed in strong wind conditions.  
 - In case of strong or gusty crosswind greater than 20 kt, Refer to FPE-IFL VAPP Determination.

## WINDSHEAR

A red flag "WINDSHEAR" is displayed on each PFD associated with an aural synthetic voice "WINDSHEAR" repeated three times.

If windshear is detected by pilot observation, apply the following recovery technique:

### ■ **At takeoff**

#### ■ **If before V1**

The takeoff should be rejected only if significant airspeed variations occur below indicated V1 and the pilot decides that there is sufficient runway remaining to stop the airplane.

#### ■ **If after V1**

THR LEVERS..... TOGA  
 REACHING VR..... ROTATE  
 SRS ORDERS..... FOLLOW

*This includes the use of full backstick, if demanded.*

Note: 1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.  
 2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

## WINDSHEAR (Cont'd)

### ■ Airborne, initial climb or landing

THR LEVERS AT TOGA.....SET OR CONFIRM

AP (if engaged).....KEEP

SRS ORDERS.....FOLLOW

*This includes the use of full backstick, if demanded.*

Note:

1. If engaged, the autopilot disengages when  $\alpha$  is greater than  $\alpha$  prot.
2. If the FD bars are not available, use an initial pitch attitude up to 17.5 ° with full backstick, if necessary. If needed, to minimize the loss of height, increase this pitch attitude.

DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF SHEAR.

CLOSELY MONITOR FLIGHT PATH AND SPEED.

RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF SHEAR.

WINDSHIELD/WINDOW ARCING

Affected WINDOW/WINDSHIELD ANTI ICE C/B.....PULL

*Pull the circuit breaker of the affected window/windshield heating system, in case of :*

- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

*On the rear C/B panel :*

- ANTI ICE L WSHLD C/B AF10 (123VU)
- ANTI ICE R WSHLD C/B AF03 (123VU)
- ANTI ICE/WINDOWS L C/B X14 (122VU)
- ANTI ICE/WINDOWS R C/B W14 (122VU)

## WINDSHIELD/WINDOW CRACKED

DIAGNOSIS OF INNER PLY.....PERFORM

*Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.*

■ **If no crack on cockpit side:**

No limitation

*The inner ply is not affected. Therefore, the window/windshield is still able to sustain the maximum differential pressure at the current flight level.*

■ **If cracks on cockpit side:**

MAX FL..... 230/MEA

*The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. The maximum flight level is restricted to FL 230/MEA to obtain  $\Delta P$  5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.*

Note: The following procedure allows maintaining  $\Delta P$  5 PSI in manual cabin pressure mode.

CAB PRESS MODE SEL..... MAN

MAN V/S CTL..... AS RQRD

Set the cabin altitude, according to the table below:

$\Delta P = 5$ PSI	FL	100	150	200	230
	CABIN ALTITUDE	0	3 000	6 000	8 000

● **When starting the descent for approach:**

CAB PRESS MODE SEL..... AUTO

Note: *If all front facing windows are affected and if sufficient visibility is not granted for approach, consider AUTOLAND. If AUTOLAND is not available, consider opening the sliding window on the PF's side, after cabin depressurization. To manually depressurize the cabin:*

CAB PRESS MODE SEL..... MAN

MAN V/S CTL..... FULL UP

*Due to the increased noise level, pay particular attention to visual warnings.*

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.13</b>
		30 MAR 12

<b>ECAM ADVISORY CONDITIONS</b>
---------------------------------

SYSTEM	CONDITIONS	RECOMMENDED ACTION
CAB PRESS	CAB VERTICAL SPEED V/S > 1 800 ft/min	CPC changeover is recommended: MODE SEL (MAN) Wait 10 s, then: MODE SEL (AUTO)
	CAB ALTITUDE altitude ≥ 8 800 ft	MODE SEL (MAN) Manual pressure control
	CAB DIFF PRESS ΔP ≥ 1.5 PSI in phase 7	LDG ELEV (ADJUST) If unsuccessful: MODE SEL (MAN) Manual pressure control
ELEC	IDG OIL TEMP ≥ 147 °C	Reduce IDG load, if possible (GALLEY or GEN OFF). If required, restore when the temperature has dropped. Restrict generator use to a short time, if the temperature rises again excessively.
FUEL	Difference between wing fuel quantities greater than 1 500 kg (3 307 lb)	FUEL MANAGEMENT (CHECK) If a fuel leak is suspected, <i>Refer to FUEL LEAK procedure.</i>
	Fuel temp greater than 45 °C in inner cell, or 55 °C in outer cell	GALLEY (OFF)
	Fuel temp lower than -40 °C in inner or outer cell	Consider descending to a lower altitude and/or increasing Mach to increase TAT.
OXY	Cockpit oxygen bottle pressure < 600 PSI.	If mask is not being used, check if it is correctly stowed.
APU	EGT > EGT MAX -33 °C (inhibited during APU start)	
	OIL QTY (message LOW OIL LEVEL pulsing)	If there is no oil leak, then the remaining oil quantity allows normal APU operation for about 10 h.
ENG	OIL PRESS P < 80 PSI	<ul style="list-style-type: none"> <li>- If oil pressure is between 80 PSI and 60 PSI continue normal engine operation.</li> <li>- If oil pressure is below 60 PSI (red indication), without the <u>ENG OIL LO PR</u> warning, continue normal engine operation (it can be assumed that the oil pressure transducer is faulty).</li> </ul> In both cases, monitor other engine parameters, especially oil temperature and oil quantity.
	OIL PRESS P > 390 PSI	Closely monitor other engine parameters for symptoms of engine malfunction. If a high oil pressure is not accompanied by other abnormal indications, operate the engine normally for the remainder of the flight. Record high oil pressure, and corresponding N2 readings, for maintenance action.
	OIL TEMP T > 155 °C	An oil temperature increase during normal steady-state operations indicates a system malfunction, and should be closely monitored for other symptoms of engine malfunction.  <u>Note:</u> <i>If the OIL TEMP increase follows thrust reduction, increasing thrust may reduce oil temperature.</i>  <i>In addition, an oil temperature increase could be related to the IDG oil cooling system. To reduce oil temperature increases before limits are reached, the following is recommended:</i> <ol style="list-style-type: none"> <li>1. <u>Low Speed</u>- Increase engine speed to increase fuel flow, and thereby cool IDG oil.</li> <li>2. <u>High Speed</u>- Reduce generator load, or turn off generator. If oil temperature continues to rise, mechanically disconnect IDG.</li> </ol>
	OIL QTY < 5 qt	If oil quantity is low at a high power setting, expect level increase after power reduction.
	NAC TEMP ≥ 320 °C	Monitor engine parameters and crosscheck with other engine.
	VIBRATION N1 ≥ 5 units N2 ≥ 5 units	Refer to HIGH ENGINE VIBRATION procedure ( <i>Refer to ABN-70 HIGH ENGINE VIBRATION</i> ).

## VAPP CALCULATION

### VAPP CALCULATION IN THE CASE OF AN ABNORMAL/EMERGENCY CONFIGURATION

$$VAPP = VREF + \Delta VREF + APPR COR$$

=

VREF												
Weight (1000 kg)	40	44	48	52	56	60	64	68	72	76	78	
VREF (KT) = VLS CONF FULL	CG < 25%	108	113	118	123	127	131	136	140	144	148	149
	CG ≥ 25%	106	111	116	121	125	129	134	138	142	146	147

+

$\Delta VREF^{(1)}$

+

APPRoach CORrection		
if $\Delta VREF \leq 10$ kt	if $10 \text{ kt} < \Delta VREF < 20$ kt	if $\Delta VREF \geq 20$ kt
APPR COR is the Highest of		
5 kt * if A/THR ON and / or in case of ice accretion**	1/3 Headwind Max = 15 kt	APPR COR = 1/3 Headwind Max = 10 kt
APPR COR + $\Delta VREF$ limited to 20 kt		APPR COR = 0 kt

\* Multiply the landing distance by an additional factor of 1.1

\*\* In CONF3, add another 5 knot speed increment and multiply the landing distance by an additional factor of 1.2 (instead of 1.1)

=

$$VAPP = VREF + \Delta VREF + APPR COR$$

TO BE INSERTED IN THE MCDU PERF APPR PAGE

(1) Refer to QRH ABN 80 LDG CONF / APPR SPD / LDG DIST following failures tables

#### EXAMPLE OF VAPP CALCULATION:

Failure : ALTN LAW  
Flight Conditions : Autothrust ON, ice accretion  
Landing Configuration : CONF 3  
Headwind : 12 kt  
Landing Weight/CG : 48 t/25 %  
VREF determined from the landing weight : 116 kt  
VREF correction due to the failure ( $\Delta VREF$ ) : 10 kt

As  $\Delta VREF$  is equal to 10 kt, the APPRoach CORrection (APPR COR) is the highest of:

- $5+5 = 10$  kt (ice accretion and landing in CONF 3)
- $1/3 \text{ Headwind} = 12 \text{ kt}/3 = 4$  kt

APPR COR = 10 kt and the landing distance must be multiplied by an additional factor of 1.2

$$VAPP = VREF + \Delta VREF + APPR CORR = 116 + 10 + 10 = 136 \text{ kt}$$

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.15</b>  30 MAR 12
---------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	-------------------------------

## USE OF THE LDG CONF / APPR SPD / LDG DIST TABLES

### USE OF THE LDG DIST FACTORS

Use the **LDG DIST factors "WITHOUT REV"** when:

- All reversers are inoperative, or
- Maximum reverse thrust on available reverser(s) is not selected, or
- The aircraft has been dispatched with one or more reverser(s) inoperative.

Use the **LDG DIST factors "WITH REV"** when at least one reverser is operative and maximum reverse thrust is selected at landing.

Note: *Not applicable if aircraft was dispatched with one reverser INOP. QRH Landing distance factors are based upon dispatch with both reversers operating.*

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR AN INDEPENDENT FAILURE

Determine the FLAPS lever position for landing to be selected

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Determine the  $\Delta VREF$
- Determine the APPRoach CORrection (*Refer to ABN-80 VAPP Calculation*)

Compute the LDG DIST:

- Determine the LDG DIST factor. Multiply it by the additional factor, if any (*Refer to ABN-80 VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

### LDG CONF / APPR SPD / LDG DIST COMPUTATION FOR MULTIPLE FAILURES

Only combine PRIMARY or INDEPENDENT failures

Determine the Flaps lever position for landing to be selected:

- Use the lowest Flaps Lever Position for landing (i.e. if FULL and 3, use 3)

Compute the VAPP:  $VAPP = VREF + \Delta VREF + APPR\ COR$

- Use the highest  $\Delta VREF$  to compute VAPP
- Determine the APPRoach CORrection (*Refer to VAPP Calculation*)

Compute the LDG DIST:

- Determine the applicable LDG DIST factors in the same column ("WITH REV." or "WITHOUT REV.")
- Multiply the applicable LDG DIST factors together, unless all values are marked with an asterisk (\*). If all values are marked with an asterisk, use the highest LDG DIST factor. Multiply it by the additional factor, if any (*Refer to VAPP Calculation*)
- Multiply the obtained LDG DIST factor by the ACTUAL LANDING DISTANCE WITHOUT AUTOBRAKE – CONFIGURATION FULL – without reversers correction (*Refer to FPE-IFL Landing Distance Without AUTOBRAKE - CONF FULL*)

Examples applicable to Dry runways / A/THR ON / No wind / WITHOUT REV./Without ice accretion:

FAILURES	Flaps Lever Position For Landing	$\Delta VREF$	APPR COR	Additional Factor	LDG DIST Factor
FLAPS FAULT (F < 3, S ≥ 1)	3	10	5	1.1	1.40*
BRK ANTI SKID	FULL	-			1.75
	3	6			1.90
	3	10			1.40×1.90×1.1=3.00
RESULT	3	10			

$VREF = 131\text{ kt.}$  Therefore  $VAPP = 131 + 10 + 5 = 146\text{ kt.}$

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<b>80.19</b>
		30 MAR 12

<b>TRIPPED C/B RE-ENGAGEMENT</b>
----------------------------------

In flight, do not reengage a circuit breaker (C/B) that has tripped by itself, unless the Captain judges it necessary to do so for the safe continuation of the flight. This procedure should be adopted only as a last resort, and only one reengagement should be attempted.

On ground, do not reengage the C/B of the fuel pump(s) of any tank. For all other C/Bs, if the flight crew coordinates the action with maintenance, the flight crew may reengage a tripped C/B, provided that the cause of the tripped C/B is identified.

 <b>DRAGONAIR</b> <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>ABNORMAL AND EMERGENCY PROCEDURES</b>	<div style="text-align: center; font-size: 24pt; font-weight: bold;">80.20</div> <div style="text-align: center; font-weight: bold;">30 MAR 12</div>
----------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------

<b>COMPUTER RESET</b>
-----------------------

When a digital computer behaves abnormally, as a result of an electrical transient, for example, the Operator can stop the abnormal behavior by briefly interrupting the power supply to its processor. The flight crew can reset most of the computers in this aircraft with a normal cockpit control (selector or pushbutton). However, for some systems, the only way to cut off electrical power is to pull the associated circuit breaker.

To perform a computer reset:

- Select the related normal cockpit control OFF, or pull the corresponding circuit breaker.
- Wait 3 s if a normal cockpit control is used, or 5 s if a circuit breaker is used (unless a different time is indicated)
- Select the related normal cockpit control ON, or push the corresponding circuit breaker
- Wait 3 s for the end of the reset.

<b>WARNING</b>	Do not reset more than one computer at the same time, unless instructed to do so.
----------------	-----------------------------------------------------------------------------------

Note: In flight, before taking any action on the cockpit C/Bs, both the PF and PNF must :

- Consider and fully understand the consequences of taking action
- Crosscheck and ensure that the C/B label corresponds to the affected system.

The computers most prone to reset are listed in the table below, along with the associated reset procedure. Specific reset procedures included in OEB or TDUs are not referenced in this table and, when issued, supersede this table.

- On ground, almost all computers can be reset and are not limited to the ones indicated in the table.

The following computers are not allowed to be reset in specific circumstances:

- ECU (Engine Control Unit on CFM engines), or EEC (Electronic Engine Control on IAE engines), and EIU (Engine Interface Unit) while the engine is running.
- BSCU (Brake Steering Control Unit), if the aircraft is not stopped.
- In flight, as a general rule, the crew must restrict computer resets to those listed in the table, or to those in applicable TDUs or OEBs. Before taking any action on other computers, the flight crew must consider and fully understand the consequences.

<b>CAUTION</b>	Do not pull the following circuit breakers: <ul style="list-style-type: none"> <li>- SFCC (could lead to SLATS/FLAPS locked).</li> <li>- ECU or EEC, EIU.</li> </ul>

**LOW VISIBILITY OPERATIONS (LVO)**

● **TAXI/LINE UP**

Maximum speed 10 kts

Complete the Before T/O checklist before taxi or after reaching the holding point.

Use ILS to confirm the correct departure runway.

● **DESCENT PREPARATION**

Check the ECAM STATUS page for any degraded approach capability:

Refer any system fault to the table of equipment required in QRH OPS.04.

Subject to aircraft status, plan for a CAT 3 DUAL approach. Observe the following minimum requirements:

	Autoland	Auto-rollout	A/THR	Auto-callout
<b>Cat 3B</b>	Required	Required	Required	Required
<b>Cat 3A</b>	Required	Preferred	Required	Required
<b>Cat 2</b>	Preferred <sup>(1)</sup>	Preferred	Preferred	Preferred

<sup>(1)</sup> If a manual landing is required, autopilot shall be disconnected by 80ft RA.

DH	DH entry on PERF APPR page
<b>With DH</b>	Insert RA from Port Page
<b>NO DH</b>	Insert "NO"

As part of the normal arrival briefing:

- Confirm LVP (Low Visibility Procedures) in force (clearance to fly a Cat 2/3 approach satisfies this requirement).
- Review LWMO and autoland requirements on the Port Page.
- For autoland, confirm that the wind is within the autoland limits.
- State the category of approach to be flown.
- Review reversion capability.
- Review task sharing, standard calls and the actions in the event of a missed approach.

● **APPROACH: REVERSION**

For any system fault that does not incur a landing capability downgrade on ECAM STATUS or FMA, the fault shall be checked against the table of equipment required in QRH OPS.04.

If a reversion to a degraded approach capability occurs and the RVR is within limits for the approach to be continued with the new capability:

- Above 1 000 ft RA, complete ECAM actions, amend the DH in the PERF APPR page and continue the approach.
- Below 1 000 ft RA, a go-around is recommended.

If a reversion to a degraded approach capability occurs and the RVR is below the minima for the new approach capability, the approach may not commence, or continue if already below 1 000 ft RA.

Unless there are sufficient visual references, a go-around is mandatory if:

- LAND green is not annunciated by 350 ft RA.
- The AUTOLAND warning light illuminates.
- During an autoland, FLARE is not annunciated by 30 ft RA. In this case, the PM shall call "NO FLARE" and the PF shall disconnect the AP and land manually if sufficient visual reference.

 DRAGONAIR <b>A320/A321</b> QUICK REFERENCE HAND BOOK	<b>COMPANY PROCEDURES</b>	CP-LVO <b>2/2</b>
		30 MAR 12

Intentionally left blank

## LVO DEPARTURE

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Takeoff Alternate
- PF to taxi / max speed 10 kt / Strobes ON
- PM to navigate using taxi chart & a/c heading
- Do not cross CAT II/III holding points without clearance
- Before T/O Checklist when a/c is stationary
- Consider TOGA
- ALL RVR's at/above Takeoff minima
- Use localiser to confirm correct runway centerline

## LVO APPROACH & AUTOLAND

### ● LHS Captain is PF. During the C-TWO + briefing review:

- Confirm LVP in force
- Review Port Page LWMO & Autoland requirements
- Check STATUS for any degraded approach capability
- State category of approach and reversion capability
- Insert DH in MCDU / Review CAT I minima
- Check surface wind within limits: AUTOLAND and MANUAL LAND (HWC30 / TWC10 / XWC20)
- Check RVR's: TDZ & MID controlling / RO advisory
- Review Task sharing & Standard Calls
- PM to call "FLARE/NO FLARE" (30 ft) & "ROLLOUT/NO ROLLOUT"
- LVP taxiway to vacate runway / LVP taxi route

#### Failures below 1000AAL and in IMC, Go-Around for:

- |                                                |                                |
|------------------------------------------------|--------------------------------|
| - α Floor                                      | - Engine Failure               |
| - Autopilot OFF                                | - No 'LAND' green by 350 ft RA |
| - Downgrade below required approach capability | - Autoland warning light       |
| - Amber Caution                                | - No "Flare" by 30 ft          |

## **RNAV (GNSS) / RNAV (RNP) APPROACH**

### **● APPROACH PREPARATION**

Database waypoints from the final approach course fix to the runway threshold or MAP shall not be modified.

Refer to OEB Index and the AML to determine if restrictions on the use of FINAL APP mode apply.

Prior to the approach, check:

- Two operative navigation systems (2 x FMGS and 2 x GPS).
- Both GPSs in NAV on the GPS MONITOR page.
- GPS PRIMARY on both MCDUs.

The aircraft shall be laterally stable by the FAF.

### **● APPROACH GUIDANCE**

FINAL APP (recommended) and NAV-FPA modes are available:

- FINAL APP mode shall be used for approach to a decision altitude (DA).
- NAV-FPA may be used for approach to a minimum descent altitude (MDA), and shall be used for approach when OAT is below the published Baro-NAV minimum temperature, or if low temperature altitude corrections are applied for the approach. Part A chapter 8 refers.

### **● AFTER COMMENCING APPROACH: NAVIGATION ALERTS**

GPS FAULT 1(2) ECAM caution:

- Continue the approach.

GPS PRIMARY LOST displayed:

- On one ND, continue using the AP/FD associated with the other ND/FMGS.
- On Both NDs:
  - Standalone approach: discontinue the approach.
  - Overlay approach: continue the approach using navaid raw data. If necessary, revert to NAV-FPA or TRK-FPA.

FM/GPS POS DISAGREE ECAM caution:

- Standalone approach: discontinue the approach.
- Overlay approach: revert to TRK-FPA and continue the approach using navaid raw data.

FMS1/FMS2 POS DIFF message on the MCDU scratchpad:

- Standalone approach: discontinue the approach.
- Overlay approach: continue the approach using navaid raw data and the AP/FD associated with the accurate (non-affected) FMGS. If necessary, revert to TRK-FPA.

## COLD WEATHER / DE-ICING - FLIGHT PREPARATION

### ● REVIEW

- ATIS - W/V (Crosswind), Precipitation, Visibility (snowfall intensity table - Part A Chapter 8). If freezing fog, note previous taxi-in time.
- The available or desirable type or De-icing/Anti-icing fluid(s) and respective mixture ratio.
- The location and method of de-icing, the supplier and KA priority.
- Runway surface and braking conditions (Friction Index).
- Length of expected or occurring delays.
- Aircraft PADDs - if APU inop, GPU required at Remote Bay de-icing (with engines shutdown).

### ● DETERMINE

- Holdover Time (HOT) using appropriate table from Part A Chapter 8 and current or expected weather conditions.
- Max RTOW and Max Crosswind - in current and expected weather conditions - Refer to PRO-SUP-91-50 Fluid Contaminated Runway.
- Fuel Required - with possible lengthy taxi delays. No fuel tankering required.
- Max ZFW and, if limiting, advise Load Control.
- Takeoff alternate (as necessary) within 340 nm.

### ● CONFIRM

- Slot time (if any).
- Boarding time (allowing for possible LMCs).
- If de-icing at the gate - the scheduled sequence/time.
- If possible - ensure vacant cabin seats available for the Pre-takeoff Contamination Inspection (PCI).

## COLD WEATHER / DE-ICING - COCKPIT PREPARATION

### ● SYSTEMS IN COLD WEATHER (REFER TO PRO-SUP-91-30)

IRS..... Align early (15 mins)  
 Pack 1 (then 2)..... ON

Note: (If the pack outlet temperature indication on ECAM is crossed amber, the associated pack controller has to be reset to ensure pack overheat protection and to recover pack outlet temperature indication.)

Probe/Window Heat.....ON, prior to external inspection

### ● PERFORMANCE

- Takeoff: Engine and/or Wing Anti-ice, Optimal Flap setting.
- Cold Weather Altimetry.
- Landing Distance: for possible immediate return.

### ● BRIEFING

- Tyre flat spots may cause nose wheel vibration on takeoff.
- Taxi-route (LVP) and speeds.
- Review fan ice shedding procedures. Refer to PRO-NOR-SOP-09.
- Review Ground De-icing procedures. Refer to PRO-SUP-91-30.

### ● PA

- Include the operational requirements to de-ice to inform and re-assure passengers.

Start Checklist ..... Complete	
<b>Note:</b> If ZFWCG/ZFW is not entered prior to start, ECAM message FUEL NO WEIGHT/CG DATA will require the entry of <b>Gross Weight</b> GW/CG on FUEL PRED page.	<b>Pushback</b> <ul style="list-style-type: none"><li>Consider starting the engines after pushback if ramp is contaminated.</li><li>Engine Oil Pressure may be unusually high after start until oil temperature stabilizes.</li></ul>
Probe/Window Heat ..... AUTO	
Further Considerations If taxi in slush/standing water - leave flaps up until holding point LVP Procedures Wing Anti-icing Operations: Select and Leave ON - Do not interrupt the 30 SEC test sequence	
Fan Ice Shedding	
Fan Ice Shedding: OAT <3 °C → 50 % N1 every 15 min and just prior to takeoff	
<u>Note:</u> When performing the static run-up, the 61-74 % N1 range should be avoided.	
A Pre Takeoff Contamination Inspection / Check, as appropriate, shall be carried out if the lower time in the HOT cell has been exceeded. Part A Chapter 8.2.3 refers.	
<b>BEFORE TAKEOFF Checklist</b>	

## CONTAMINATED RUNWAY OPERATIONS

### ● TAKEOFF

Use TOGA thrust. FLEX thrust may ONLY be used if the equivalent condition is WET.

Do NOT takeoff from an ICY runway, or contaminated runway if:

- the friction coefficient is at or less than 0.25 ICAO, or 25 USA. Part A Chapter 8.2.3 refers.
- the contamination is greater than:
  - 12.7 mm(1/2 in) of SLUSH,
  - 25.4 mm(1 in) of WET SNOW,
  - 101.6 mm(4 in) of DRY SNOW.

ACARS RTOW sets an OAT RANGE for each condition to provide a performance buffer and protect against entry errors. Entered temperatures outside of the acceptable range will NOT produce any RTOW data.

Equivalency: For types or depths of contaminants not listed above, use the following guidelines:

CONTAMINANT	DEPTH OF CONTAMINANT	EQUIVALENT TO	ACARS CODE	OAT RANGE*
WATER	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm WATER	WT6	0 to 51 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm WATER	WT12	
SLUSH	≤ 3 mm	WET	WET (W)	-5 to 51 °C
	>3 mm and ≤ 6.3 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>6.3 mm and ≤ 12.7 mm	12.7 mm SLUSH	SH12	
WET SNOW	≤ 4 mm	WET	WET (W)	-5 to 51 °C
	>4 mm and ≤ 12.7 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>12.7 mm and ≤ 25.4 mm	12.7 mm SLUSH	SH12	
DRY SNOW	≤ 15 mm	WET	WET (W)	-5 to 51 °C
	>15 mm and ≤ 50.8 mm	6.3 mm SLUSH	SH6	-5 to 15 °C
	>50.8 mm and ≤ 101.6 mm (MAX)	12.7 mm SLUSH	SH12	-5 to 15 °C
COMPACTED SNOW	--	COMPACTED SNOW	CSNW	-54 to 5 °C

*\*Where actual OAT is below the OAT Range, use the lower limit of the OAT Range. If actual OAT is above the upper limit of the OAT Range, takeoff is NOT permitted. Re-evaluate the existing contaminant condition.*

### ● MAXIMUM CROSSWIND FOR TAKEOFF AND LANDING

Reported braking action	Reported runway friction coefficient	Maximum crosswind (kt)		Equivalent runway condition*
		Takeoff	Landing	
Good (on a wet runway)	≥ 0.4	29	33	1
Good/Medium	0.39 to 0.36	29	29	1
Medium	0.35 to 0.3	25		2/3
Medium/poor	0.29 to 0.26	20		2/3
Poor	≤ 0.25	15		3/4
Unreliable		5		4/5

\* Equivalent runway condition (only valid for maximum crosswind determination)

1. Damp or wet runway (less than 3 mm water depth)
2. Runway covered with slush
3. Runway covered with dry snow
4. Runway covered with standing water with risk of hydroplaning or wet snow
5. Ice runway or high risk of hydroplaning

Note: The maximum crosswind values are given without gust.

LOW TEMPERATURE ALTIMETRY

Part A chapter 8 refers.

When temperature at the aerodrome is below the ISA value, it is the responsibility of the Commander to consider the effect of temperature on the minimum and reference altitudes. If corrections are to be made, the guidelines below shall be used.

- **CORRECTIONS TO MSA**
  
- **CORRECTIONS TO ALTITUDES BELOW MSA**

## WIND COMPONENT CHART - A320

**Weather LIMITS:**

SO 1000' / 3000m 10 knots x-wind  
JFO 500' / 2000m 15 knots x-wind  
FO ≥ CAT I 20 knots x-wind

**CAT II Autoland**  
30 knots headwind  
20 knots x-wind  
10 knots tailwind
